

C0. Introdução

C0.1

(C0.1) Faça uma descrição e uma introdução geral sobre a sua organização.

Klabin is the Brazilian largest paper producer and exporter. Is considered the leader in the production of papers and cartons for packaging, corrugated packaging and industrial bags, and markets timber in logs. It is also the only Brazilian company to simultaneously supply hardwood pulp (eucalyptus), softwood pulp (pine) and fluff pulp to the market.

Founded in Brazil in 1899, currently has 18 industrial units, with 17 units distributed in eight Brazilian states and one in Argentina. Klabin also has commercial offices in eight Brazilian states, a branch office in the United States, Austria, and sales representatives and agents in many countries.

The paper and paperboard for packaging manufactured, as well as corrugated board packaging and industrial bags offer protection and safety to foods, beverages, hygiene and cleaning products, electronics and consumer appliances, cement, seeds, wheat flour, chemical products and other items. These products are a measure of how Klabin is present in the people's daily lives.

Hardwood and softwood pulp, used individually or together as a mix, give the essential characteristics to diverse types of paper: the ideal level of strength, softness and absorption for hygiene products, strength and opacity for printing and writing paper, and other specific properties required for specialty papers.

We are a world reference in sustainable development. Our forestry and industrial activities are based on this concept to preserve the biodiversity and the ecological balance of the ecosystems of the regions where we operate. Our Sustainability policy integrates the entire production chain to offer the market a responsible product with the environment and in line with the UN Sustainable Development Goals.

Since 2014, Klabin has been part of the Corporate Sustainability Index (ISE) of the BM&FBovespa. In addition, we are also a signatory to the United Nations Global Compact and the Brazilian Pact to Eradicate Slave Labor, and look for suppliers and business partners that adopt the same values of ethics, transparency and respect for the principles of sustainability.

Klabin reserves **43%** of its land for preserved native forests (48% of total forest areas). In addition, it maintains its own areas with planted forests for the manufacture of its products. A pioneer in adopting the concept of sustainable development, Klabin was the **first** pulp and paper company in the Southern Hemisphere to obtain, in 1998, the Forest Stewardship Council®-FSC® certification which attests to management practices that conserve natural resources, provide fair working conditions and encourage healthy relations with local communities. A pioneer in the adoption of mosaic planting concepts (a system that intermingles preserved native forests with planted forests) in its forestry management, Klabin has **239,000 hectares** planted with pine and eucalyptus and **216,000 hectares** of preserved native forests.

Since 2013, Klabin has been participating in the permanent "Empresas Pelo Clima" (Companies for the Climate), which aims to mobilize, sensitize and articulate business leaders for the management and reduction of emissions of greenhouse gases (GHG), the management of climate risks and the proposal of public policies and positive incentives in the context climate change.

In 2017, "Guia Exame de Sustentabilidade" elected Klabin the Most Sustainable Company in the Pulp and Paper Sector. The Guide is one of the most relevant publications on sustainability in the market.

Klabin also achieved a high level of performance by achieving 100% performance in Responsible Fiber Supply in the Environmental Index of Paper and Pulp Companies - Environmental Paper Company Index 2017 (EPCI), held every two years by WWF.

Respect for communities is a guiding value of Klabin in all the regions where it operates. Having clear governance criteria, providing transparency to all its acts and promoting the engagement of local stakeholders are the company's constant concerns in managing the social impacts of its activities.

Klabin invests in the territory so that all population benefits from initiatives in the areas of local development, education, culture and environmental education. For its employees, it offers programs that include personal development and volunteer activities.

An example is the Matas Sociais Program (Planning Sustainable Properties) where Klabin assists family farmers in sustainable planning and diversification of land use. It encourages family farming, development of the production and consumption chain and entrepreneurship. It has the partnership of the Brazilian Service of Support to Micro and Small Businesses (Sebrae), the international organization The Nature Conservancy (TNC) and Apremavi. The initiative has already benefited more than 400 properties.

The company creates **19,000** jobs (direct and indirect) and invests regularly in people development to promote competencies specific to its business, well-being and safety.

Klabin is recognized for its sustainable management adopted, which aims forest multipurpose usage. The use of the environmental practices used by the company, as well as the proper management of the landscape, allow the excellent exploitation of the potential of production of the forests and the protection of the natural resources. Klabin was the first pulp and paper company in the Southern Hemisphere to obtain, in 1998, the Forest Stewardship Council®-FSC® certification (FSC-C022516) which attests to management practices that conserve natural resources, provide fair working conditions and encourage healthy relations with local communities. Timber is classified as the main raw material for pulp and paper production. Based on the total amount of inputs consumed in 2018 for total production of Klabin S/A, wood represents 96.45% of the amount of the inputs. - Calculation: % Revenue = Total Quantity of Wood (thousand t / year) / Total Quantity of Input (thousand t / year) * 100 % Revenue = (12,076.48 / 12,520.41)*100 = 96.45% It is also important to mention that, considering all the inputs consumed by Klabin in 2018, 98.3% are from renewable origin

C1. Governança

C1.1

(C1.1) Existe supervisão pelo Conselho das questões relacionadas ao clima em sua organização?

Sim

C1.1a

(C1.1a) Identifique o(s) cargo(s) do(s) indivíduo(s) do conselho responsável(is) pelas questões relacionadas ao clima (não inclua os nomes).

| Cargo dos indivíduos | Por favor, explique |
|----------------------|---|
| Diretor do Conselho | INDUSTRIAL TECHNOLOGY, INNOVATION, SUSTAINABILITY AND PULP BUSINESS OFFICER has the responsibility over Climate Change and its related studies on impacts and opportunities. Alongside him, the Environmental and Sustainability Corporate team is responsible for the day-to-day management of the issue with the responsibility of monitoring global and national climate agendas and mapping their related risks and opportunities. It is worth mentioning that Klabin maintains a fixed sustainability committee main composed of directors, with the Director of Industrial Technology and Sustainability as the sponsor and Sustainability and Environment Executive Manager as the technical director of the commission. Also participate in this committee, managers of people and corporate services, legal directory, industrial directory of papers and forest management areas. He is also responsible for climate change issues, managing a corporate sustainability team that works with this subject on a daily basis. |
| Comitê do conselho | Klabin maintains a fixed sustainability committee main composed of directors, with the Director of Industrial Technology and Sustainability as the sponsor and Sustainability and Environment Executive Manager as the technical director of the commission. Also participate in this committee, managers of people and corporate services, legal directory, industrial directory of papers and forest management areas. He is also responsible for climate change issues, managing a corporate sustainability team that works with this subject on a daily basis. |

C1.1b

(C1.1b) Forneça mais detalhes sobre a supervisão pelo Conselho das questões relacionadas ao clima.

| Frequência na qual as questões relacionadas ao clima são um item da agenda programada | Mecanismos de governança nos quais as questões relacionadas ao clima estão integradas | Por favor, explique |
|---|--|--|
| Programado - todas as reuniões | Análise e orientação de estratégia Análise e orientação de planos de ação maiores Análise e orientação de políticas de gestão de riscos Definição de objetivos de desempenho Monitoramento da implementação e do desempenho de objetivos Monitoramento e supervisão do progresso em relação às metas e objetivos para tratar das questões relacionadas ao clima | Issues related to climate change are part of the organization's sustainability policy and objectives. Item number 13 of Klabin S/A sustainability policy: "Ensure that the company's operations are constantly seeking to reduce greenhouse gas (GHG) emissions." Taking into consideration this, the organization's goals and objectives are defined based on the organization's principles. Klabin has restructured its team in 2018 and created a specific corporate area of Sustainability and Environment that has as one of its objectives the day-to-day management of the issue with the responsibility of monitoring global and national climate agendas and mapping their related risks and opportunities. This change is focused on the importance that the organization sees to deal daily on corporate issues related to the environment and industrial sustainability in the different industrial units and businesses of Klabin. In addition, the issues related to atmospheric emissions integrate the environmental indices of the main units of Klabin S/A. These indicators are monitored and analyzed on a monthly basis. Definitions and main action plans to meet defined goals involve the operational and strategic levels of the organization. Klabin maintains a fixed sustainability committee main composed of directors, with the Director of Industrial Technology and Sustainability as the sponsor and Sustainability and Environment Executive Manager as the technical director of the commission. Also participate in this committee, managers of people and corporate services, legal directory, industrial directory of papers and forest management areas. Items related to climate change and risks and opportunities are fixed agenda items of critical analysis involving senior management (managers and directors). The aligned strategies and actions defined in the committee are guided by financial, legal, social and environmental themes. In general, all these items taken into consideration during these meetings are important issues for the definition of the organization's growth strategy, considering new technologies and new projects for the company in line with the UN Sustainable Development Goals. |

C1.2

(C1.2) Forneça o(s) cargo(s) de gestão ou comitê(s) de nível mais alto com responsabilidade pelas questões relacionadas ao clima.

| Nome dos cargos e/ou comitês | Responsabilidade | Frequência de divulgação ao Conselho sobre as questões relacionadas ao clima |
|---|--|--|
| Diretor de Sustentabilidade (CSO) | Avaliação e gestão de riscos e oportunidades relacionados ao clima | Trimestralmente |
| Comitê de Sustentabilidade | Avaliação e gestão de riscos e oportunidades relacionados ao clima | Trimestralmente |
| Gerente de Meio Ambiente/Sustentabilidade | Avaliação e gestão de riscos e oportunidades relacionados ao clima | Frequência maior que trimestralmente |

C1.2a

(C1.2a) Descreva em que local da estrutura organizacional encontra(m)-se este(s) cargo(s) e/ou comitê(s), quais são suas responsabilidades associadas e como são monitoradas as questões relacionadas ao clima (não inclua os nomes dos indivíduos).

1) Where in the organizational structure these position (s) and / or committee (s) meet and also the specific responsibilities of position (s) and / or committee(s):

- Chief Sustainability Officer (CSO): Highest level of the organization, responsible for the execution of the Board of Directors' deliberations and the day-to-day management of the business. Has the responsibility over Climate Change and its related studies on impacts and opportunities

- Sustainability committee: composed by directors, with the Industrial Technology, Innovation, Sustainability and Pulp Business Officer as the sponsor. Sustainability and Environment Executive Manager is the technical responsible of the Committee. Also participate in this committee, Industrial Business Officer, People and Corporate Services Director, Forestry Director and Legal and Integrity Director.

Items related to climate change and risks and opportunities are fixed agenda Items of critical analysis involving senior management (managers and directors). Has the objective of following both global and national Climate agendas and map its related risk and opportunities.

- Environment / Sustainability Executive Manager: positioned in the organizational structure below the director, responsible for consolidating and leveraging sustainability practices and environment.

2) Why responsibilities for climate issues have been assigned to this position (s) or committee (s):

- Chief Sustainability Officer (CSO) and Environment / Sustainability Executive Manager: Due to the importance of the theme when related to the organization's policy, goals and objectives.

- Sustainability committee: The objective of centralizing the information in this committee is with the presence of the directors in this group and, in addition, it is done with the objective of giving strength to the subject in the update of the information and in the decision making for the strategy of the organization.

3) How climate issues are monitored by the position (s) and / or committee (s):

Klabin has restructured its team in 2018 and created a specific corporate area of Sustainability and Environment that has as one of its objectives the day-to-day management of the issue with the responsibility of monitoring global and national climate agendas and mapping their related risks and opportunities.

The sustainability committee, which is made up of a representative of the board of directors, and also aims to follow global and national climate agendas and map their related risks and opportunities in decision-making.

Those changes are focused on the importance that the organization sees to deal daily on corporate issues related to the environment and industrial sustainability in the different industrial units and businesses of Klabin.

The monitoring process at Klabin starts with day-to-day management by the environmental teams of each Klabin facilities and / or by the team of assistants from the corporate area of environment and sustainability. The management of these items is carried out by these areas along with their coordinators and their respective manager, who periodically critically examines the items related to this subject so that they are brought to the steering committee for discussion and strategic decision making for the organization.

C1.3

(C1.3) Há incentivos para a gestão de questões relacionadas ao clima, incluindo o cumprimento de metas?

Sim

Sustainability Director is response for Environmental, Climate and Social issues and has specific goals related: Klabin is continually investing to raise the use of renewable sources in our energy matrix and consequently develop products with lower carbon footprint. In recent years, it have progressively replaced fuel oil by biomass (vegetable matter from forestry operations) as fuel in our boilers, reaching, in 2014, 86.5% of renewable sources for energy generation – in 2018 we reached 89.12% of renewable sources for energy generation, reaching a number higher than the target of 88%. This percentage includes, as well as biomass, burning of black liquor (by-product generated in the industrial process) and our own hydraulic power. In addition, Klabin is looking for electricity from clean sources, such as the wind and sun.

| Linha 1 | Semestralmente ou com frequência maior | >6 anos | The scope of the assessment includes Klabin's forestry, industrial, logistic and port operations in Brazil. The sustainability committee (which is made up of a representative of the board of directors), aims to follow global and national climate agendas and map their related risks and opportunities in decision-making. Klabin conducts studies on its vulnerabilities regarding climate change based on global models such as the IPCC's Assessment Reports and on local scientific findings focus on understanding risks and opportunities, especially those with the highest potential to create a significant change in its business. Klabin prioritizes adaptive measures related to reputational and financial risks. Quarterly, Klabin risk team monitors with the representatives of each unit the risks and opportunities observed. In addition, annually the Klabin corporate risk matrix is updated based on the results of the monitoring. Main risks mapped: Changes in Regulation and Physical Climate Parameters |

C2.2b

(C2.2b) Forneça mais detalhes sobre os processos da organização para a identificação e avaliação de riscos relacionados ao clima.

Klabin has restructured its team in 2018 and created a specific corporate area of Sustainability and Environment that has as one of its objectives the day-to-day management of the issue with the responsibility of monitoring global and national climate agendas and mapping their related risks and opportunities.

The sustainability committee, which is made up of a representative of the board of directors, and aims to follow global and national climate agendas and map their related risks and opportunities in decision-making.

To understand the potential risk to which its activities are subject, as well as the adaptive measures required to face such risks, Klabin conducts studies on its vulnerabilities regarding climate change. The study is always based on global models such as the IPCC's Assessment Reports and on local scientific findings and focus on understanding risks, especially those with the highest potential to create a significant change in its business operations, revenues and expenses. The physical, regulatory, reputational and financial.

Once assessed (or updated), each potential risk/opportunity receives adaptive action-plan in order to find the best way to address it throughout the company.

Klabin has a specific area for risk management and controls of the organization. This management considers the entire organization as part of the scenario analysis. In this matrix we consider, for example, the categories of commodities, economic scenario, international policies, government changes, Research and Development, Climate Change, environmental accidents, environmental regulations, business continuity plan, among others. The financial impact is one of the main indicators of the impact of the risk raised, which can vary from an indicator of 1 to 4 depending on the estimated values. A calculation on financial, reputational and environmental loss is applied to define a degree of impact (low, medium, high or very high) which will subsequently be correlated to vulnerability, generating a risk result referenced by a heat map (risk matrix).

For risks, the magnitude and likelihood of the adverse effects will determine the timeframe of company's action. Each Business Unit is responsible for embracing its own risks (pointed out by the vulnerability matrix) and address it accordingly. The Sustainability and Environmental area alongside with Sustainability Committee are the responsible for monitoring, testing and scaling up identified opportunities. On a quarterly basis, Klabin S / A's risk team monitors with the representatives of each Klabin unit the risks and opportunities observed. All these identified opportunities are linked and correlated with the Sustainable Development Goals, a UN initiative that Klabin voluntarily joined in 2016, including these goals as an integral part of its management and growth planning for the coming years.

The applied methodology is based on the COSO (Committee of Sponsoring Organizations of the Treadway Commission), where Klabin determines the evaluation criteria of Impact and Vulnerability of each listed risk, considering a heat map for the impact classification and vulnerability.

One of the risks mapped on Klabin's matrix, for example, is the increase in temperature and increase in the frequency of intense heat waves that can increase the growth of forest pests due to the increase of thermal stress on Klabin's plantations. This risk led the organization to strategically decide to create the Department of Forest Efficiency and Ecophysiology which monitors possible future climate scenarios, developing a modeling of data related to exposure to climatic parameters and assessing the impact of changes in planted forests, and recommends the necessary measures in case of adverse effects.

Klabin also developed, together with a company specialized in the theme, a study to define its risks related to climate change. The steps of this study were separated into internal mapping (information gathering and temporal alignment), climate modeling study and identification of risks and opportunities. After defining the risks, they were classified according to their reliability, magnitude and severity.

C2.2c

(C2.2c) Quais dos seguintes tipos de riscos são considerados nas avaliações de riscos relacionados ao clima da organização?

| | Relevância e inclusão | Por favor, explique |
|--------------------------|------------------------------|---|
| Regulamentação atual | Relevante, sempre incluído | Klabin developed, together with a company specialized in the theme, a study to define its risks related to climate change. The steps of this study were separated into internal mapping (information gathering and temporal alignment), climate modeling study and identification of risks and opportunities. After defining the risks, they were classified according to their reliability, magnitude and severity. One of the identified risks is regulatory risks, which indicate that the establishment of regulations related to fuel / energy consumption and the establishment of GHG emission limits are considered relevant for Klabin as they may lead to Increased costs for operation of the whole organization, Mainly in the Monte Alegre and Puma units (located in the state of Paraná), Otacilio Costa and Correia Pinto units (Santa Catarina) and Angatuba unit (São Paulo), which are the largest units and consequently the largest consumers of fuels. As a control, Klabin actively takes part in discussion, forums and workshops related to Climate Changes challenges and its possible impacts on legislation (among others). Klabin is reference of public consults of carbon emissions and climate policies. The legislative proposes are done by APC Group, which represents Klabin and others companies. Klabin also has clear guidelines that orientates its activities planning and operations towards the management of Climate Change and its related regulations. Its pillars basically, relies on making constant improvements to make its operations more efficient in terms of emissions, the establishment of targets for GHG emissions and the assessment of business vulnerabilities in face of climate change. |
| Regulamentação emergente | Relevante, sempre incluído | Any new regulations related to emissions limits will be relevant for Klabin, mainly in the Monte Alegre and Puma units (located in the state of Paraná), Otacilio Costa and Correia Pinto units (Santa Catarina) and Angatuba unit (São Paulo) which are the units with higher atmospheric emissions. While the company has been using more efficient technologies and equipment, it has adopted an increasingly cleaner matrix, and has high carbon stock and a great potential to generate new CO2eq credits. In 2016 Klabin developed, together with a company specialized in the theme, a study to define its risks related to climate change. The steps of this study were separated into internal mapping (information gathering and temporal alignment), climate modeling study and identification of risks and opportunities. After defining the risks, they were classified according to their reliability, magnitude and severity. One of the identified risks is regulatory risks, which indicate that the establishment of regulations related to fuel / energy consumption and the establishment of GHG emission limits are considered relevant for Klabin as they may lead to Increased costs for operation of the whole organization. As a control, Klabin actively takes part in discussion, forums and workshops related to Climate Changes challenges and its possible impacts on legislation (among others). Klabin is reference of public consults of carbon emissions and climate policies. The legislative proposes are done by APC Group, which represents Klabin and others companies. Klabin also has clear guidelines that orientates its activities planning and operations towards the management of Climate Change and its related regulations. Its pillars basically, relies on making constant improvements to make its operations more efficient in terms of emissions, the establishment of targets for GHG emissions and the assessment of business vulnerabilities in face of climate change. |
| Tecnológico | Relevante, sempre incluído | Klabin developed, together with a company specialized in the theme, a study to define its risks related to climate change. The steps of this study were separated into internal mapping (information gathering and temporal alignment), climate modeling study and identification of risks and opportunities. After defining the risks, they were classified according to their reliability, magnitude and severity. This risk matrix Klabin considers the gap in relation to marketing and technological trends of development of new products and / or processes as a risk to the organization as a whole. Concluded in 2017, the new Klabin Technology Center in Telêmaco Borba (Paraná), is raising Research, Development and Innovation (R & D + I) activities in the company to a new level (including renewable energy studies and adaptations). The initiative is part of Klabin's three- year investment plan (2015 to 2017), which provides for R \$ 70 million to be allocated to R & D + I processes. The Technology Center has lines of research in the areas of forest base development, pulp development, paper, new forest-based technologies and reduction of environmental impacts. In 2018 we have expanded our focus on innovation and high technology to respond to the demands of the market and to seek new cycles of growth, aiming to develop initiatives aimed at sustainable management and operational excellence. Klabin announced another investment in innovation with the construction of a 'pilot plant park'. The space will be built with the contribution of 32 million BRL in research and development. In this park, studies and tests will be carried out on some research fronts. One of them will be with microfibrillated pulp (MFC), a renewable source, which will be incorporated into the company's paper production lines in the future to improve product quality and strength. Another research front will be the extraction and use of lignin in the products, a very resistant natural polymer extracted from trees. Of renewable origin, lignin and its derivatives can substitute raw materials of fossil origin, among other applications of high added value in industries and several segments. |
| Jurídico | Relevante, sempre incluído | The legal requirements are considered relevant for Klabin as they may lead to Increased costs for operation of the whole organization. Klabin actively takes part in discussion, forums and workshops aimed at Climate Changes challenges and its possible impacts on legislation (among others). Klabin is reference of public consults of carbon emissions and climate policies. The legislative proposes are done by APC Group, which represents Klabin and others companies. For example, a Cap & Trade scheme could affect competitiveness and raise operational costs due to the imposition of a carbon price, mainly in the Monte Alegre and Puma units (located in the state of Paraná), Otacilio Costa and Correia Pinto units (Santa Catarina) and Angatuba unit (São Paulo) which are the units with higher atmospheric emissions. Klabin also has clear guidelines that orientates its activities planning and operations towards the management of Climate Change and its related regulations. Its pillars basically, relies on making constant improvements to make its operations more efficient in terms of emissions, the establishment of targets for GHG emissions and the assessment of business vulnerabilities in face of climate change. |
| Mercado | Relevante, sempre incluído | Climate change may induce changes in customer preferences for products and services that emit less greenhouse gases. The logistics industry is an important component of these emissions may be under pressure to reduce distances traveled and greenhouse gas emissions, requiring the use of cleaner fuels, replacement of old fleets with new and re-planning of the operation. An example of outcome is the creation of the Ecophysiology department, which is responsible for monitoring current and future trends of climate elements such as changing in rainfall, winds and temperature patterns and for anticipating possible impacts on the forest productivity. Results from this analysis provides lines of action, for instance, to the R&D areas which become aware of new developments or innovation that they must pursue in order to face Climate Change threats and opportunities. We constantly use the relationship with our stakeholders as a source of consultation for new lines of research and market demands in relation to the risks to the business and possible sustainable alternatives to be developed. From the trends, demands and constant updates of the market Klabin directed its new investment cycles. In 2018 we announced another investment in innovation with the construction of a 'pilot plant park'. The space will be built with the contribution of 32 million BRL in research and development of new products. In this park, studies and tests will be carried out on some research fronts. One of them will be with microfibrillated pulp (MFC), a renewable source, which will be incorporated into the company's paper production lines in the future to improve product quality and strength. Another research front will be the extraction and use of lignin in the products, a very resistant natural polymer extracted from trees. Of renewable origin, lignin and its derivatives can substitute raw materials of fossil origin, among other applications of high added value in industries and several segments which are directly linked to the consumer market and its trends. |
| Reputação | Relevante, sempre incluído | To understand the potential risks and opportunities to which its activities are subject, as well as the adaptive measures required to face such risks and opportunities, Klabin conducts studies on its vulnerabilities and possibilities regarding climate change. The study is always based on global models such as the IPCC's Assessment Reports and on local scientific findings and focus on understanding risks and opportunities, especially those with the highest potential to create a significant change in its business operations, revenues or expenses in company and/or asset level. The scope of the assessment includes Klabin's forestry, industrial and port operations in Brazil. The main risks found are divided into the following categories: physical, regulatory, reputational and financial. Klabin prioritizes adaptive measures related to reputational and financial risks. Regulatory risks are not a priority, since there is no specific regulation for the pulp and paper industry so far, regarding Climate Changes. This is one of the types of risk that is integrated into the risk management assessment and is constantly updated through meetings with members of the sustainability committee, the Board of Directors, the commercial area and the board of directors, who discuss changes and make contributions on this subject. Reputational impacts are considered in the climate risks developed by the company and are measured / classified according to the risk management methodology that evaluates this impact according to the period of negative image exposure. Periods of damage to the public image: > 24 months - critical impact, 12 to 24 months - high impact, <12 months - medium impact, without damage to the public image - low impact For example, in Santa Catarina and Paraná States, to mitigate the impacts of possible drought scenarios., Klabin is working so that its plants consume less water from natural resources and has been developing water recycling and reuse programs for use in irrigation, return to the manufacturing process, and equipment cleaning. - Intense Rainfall: Klabin has an efficient operational logistics system, capable of working under adverse rain and muddy conditions. Contour lines and containment berms on roads have already being used to prevent the risk of erosion. |
| Parâmetro físico agudo | Relevante, sempre incluído | Klabin developed, together with a company specialized in the theme, a study to define its risks related to climate change. The steps of this study were separated into internal mapping (information gathering and temporal alignment), climate modeling study and identification of risks and opportunities. After defining the risks, they were classified according to their reliability, magnitude and severity. Changes in precipitation extremes and/or droughts could compromise the development of seedlings. Heavy rainfall can cause runoff entrainment of seedlings, floods, and cause soil drenching. Moreover, it can affect the logistics of removing wood from forest areas. Strong winds could paralyse ports used by Klabin (for example, Paranaguá Port Region in Paraná State) causing delays in deliveries and dissatisfied clients. The forest department of Klabin constantly monitors the climatic conditions of the regions where Klabin has its forests planted. This monitoring aims to assess trends at the acute and chronic levels of climate variables that may interfere with forest productivity and development. The organization has an efficient operational logistics system, capable of work under adverse rain conditions. Contour lines and containment berms on roads are already being used to prevent the risk of erosion. Also, Klabin works to continuously develop seedlings with higher resistance to cold and frost, focusing on increasing productivity and pulp volume yield. |
| Parâmetro físico crônico | Relevante, sempre incluído | Klabin developed, together with a company specialized in the theme, a study to define its risks related to climate change. The steps of this study were separated into internal mapping (information gathering and temporal alignment), climate modeling study and identification of risks and opportunities. After defining the risks, they were classified according to their reliability, magnitude and severity. The tendencies during the years related to changes in precipitation extremes and/or droughts could compromise the development of seedlings and planted areas development. Also, temperature variations during the years pose a risk to Klabin's business because they may significantly affect forest development, impacting seedling growth. Increase in sea level during the years could paralyse ports used by Klabin (for example, Paranaguá Port Region in Paraná State) causing delays in deliveries and dissatisfied clients. Klabin is working so that its plants consume less water from natural sources and developing water recycling and reuse for irrigation. Contour lines and containment berms on roads are already being used to prevent the risk of erosion. Also, Klabin works to continuously develop clones with higher resistance to cold and frost, focusing on increasing productivity and pulp volume yield. The forest department of Klabin constantly monitors the climatic conditions of the regions where Klabin has its forests planted. This monitoring aims to assess trends at the acute and chronic levels of climate variables that may interfere with forest productivity and development. |

Contour lines and containment berms on roads are already being used to prevent the risk of erosion. |
| A jusante | Relevante, sempre incluído | To understand the potential risks/opportunities to which its activities are subject, as well as the adaptive measures required to face such risks/opportunities, We conduct studies on its vulnerabilities and possibilities regarding climate change. The study is based on global models such as the IPCC Assessment Reports and focus on understanding risks and opportunities, especially those with highest potential to create a significant change in its business operations, revenues or expenses in company and/or asset level. The scope of the assessment includes Klabin's forestry, industrial and port operations in Brazil. The main risks are divided into the categories: physical, regulatory, reputational and financial. Klabin prioritizes adaptive measures related to reputational and financial risks. In 2016 Klabin developed, with a company specialized in the theme, a study to define its risks related to climate change. The steps of this study were separated into internal mapping (information gathering and temporal alignment), climate modeling study and identification of risks and opportunities. After defining the risks, they were classified according to their reliability, magnitude and severity. Downstream risk are considered relevant for the organization and area always included in the risk assessment. For example, climate change may induce changes in customer preferences for products and services that emit less greenhouse gases. The logistics industry is an important component of these emissions may be under pressure to reduce distances traveled and greenhouse gas emissions, requiring the use of cleaner fuels, replacement of old fleets with new and re-planning of the operation. Results from this analysis provides lines of action, for instance, to the R&D areas which become aware of new developments or innovation that they must pursue in order to face Climate Change threats and opportunities. An example of outcome is the "Salvador" project, an equipment that operates installed in trucks that controls the speed and rotation of the vehicle in the best standard of efficient driving in regards to fuel economy. The main indicator evaluated is the increase in average productivity of drivers expressed in Km/L (vehicle autonomy). 122 equipment were installed in vehicles of our fleet. With the reduction of diesel consumption, we have a reduction of 920.43 tCO2eq/year. |

C2.2d

(C2.2d) Descreva seus processos para a gestão de riscos e oportunidades relacionados ao clima.

To understand the potential risks and opportunities to which its activities are subject, as well as the adaptive measures required to face such risks and opportunities, Klabin conducts studies on its vulnerabilities and possibilities regarding climate change. The study is always based on global models such as the IPCC's Assessment Reports and on local scientific findings and focus on understanding risks and opportunities, especially those with the highest potential to create a significant change in its business operations, revenues or expenses in company and/or asset level. The scope of the assessment includes Klabin's forestry, industrial and port operations in Brazil.

The main risks found are divided into the following categories: physical, regulatory, reputational and financial. Klabin prioritizes adaptive measures related to reputational and financial risks. Regulatory risks are not a priority, since there is no specific regulation for the pulp and paper industry so far, regarding Climate Changes.

On an asset level, the main considered risks are physical risks once they are evaluated by region of interest (For example, The sea level rise in Paranaguá Port, one of the main ports used by Klabin). In addition, it is important to mention that Klabin evaluate all the risks categories independent of company or asset level of impact.

Once assessed (or updated), each potential risk/opportunity receives adaptive action-plan in order to find the best way to address it throughout the company. For risks, the magnitude and likelihood of the adverse effects will determine the timeframe of company's action. Each Business Unit is responsible for embracing its own risks (pointed out by the vulnerability matrix) and address it accordingly. The Sustainability and Environmental area alongside with Sustainability Committee are the responsible for monitoring, testing and scaling up identified opportunities.

Apart from the magnitude and likelihood analysis pointed out by the vulnerability matrix, which helps to determine the timeframe of company's action, Klabin performs, whenever significant changes occur in the operations of the company, a materiality study. Klabin believes that prioritizing its business strategies by taking into consideration the business strategies of its stakeholders is fundamental for building a future of perpetuity, responsibility and consensus, including Climate Changes issues. The results of this broad consultation help to point out priorities which company should address within its Sustainability strategy in the short, medium and long term. During the last cycle of study, climate change, especially regarding water, energy and biodiversity issues, was elected by stakeholders as one of main concerns and therefore is prioritized by Klabin.

Transition Risk / Opportunity Example: A cap & trade scheme related to the imposition of a carbon price may affect the production of paper and pulp for the Klabin Units affecting directly in competitiveness by raising production costs. As a way of managing this risk Klabin has been using more efficient technologies and equipment's, it has adopted an increasingly cleaner matrix, and has high carbon stock. In addition, as a control, Klabin actively takes part in discussion, forums and workshops related to Climate Changes challenges and its possible impacts on legislation (among others). Klabin is reference of public consults of carbon emissions and climate policies. The legislative proposes are done by APC Group, which represents Klabin and others companies. Klabin also has clear guidelines that orientates its activities planning and operations towards the management of Climate Change and its related regulations. Its pillars basically, relies on making constant improvements to make its operations more efficient in terms of emissions, the establishment of targets for GHG emissions and the assessment of business vulnerabilities in face of climate change.

Physical Risk / Opportunity example: Heavy rainfall can cause runoff entrainment of seedlings, floods, and cause soil drenching. Moreover, it can impact the logistics of removing wood from forest areas. The organization has an efficient operational logistics system, capable of work under adverse rain conditions. Contour lines and containment berms on roads are already being used to prevent the risk of erosion. As a way of managing this risk Klabin created the Ecophysiology department, which is responsible for monitoring current and future trends of climate elements such as changing in rainfall, winds and temperature patterns and for anticipating possible impacts on the forest productivity. Results from this analysis provides lines of action, for instance, to the R&D areas which become aware of new developments or innovation that they must pursue in order to face Climate Change threats and opportunities.

298438782

Explicação do valor do impacto financeiro

Minimum and Maximum value (BRL) which represents a simulation of carbon pricing in Brazil, using as a reference the minimum and maximum global price of carbon tax multiplied by the total quantity emitted by Klabin in the year 2018 not considering that CO2 removals by native and planted forests could serve as a reduction in the amount paid for the company's atmospheric emissions

Método de gestão

We will continue to participate in initiatives such as "Companies for the Climate" and in committees representing our sector in Brazil, which aim to articulate business leaders for the management and reduction of greenhouse gas emissions, climate risks and the proposal of policies in climate change and carbon pricing context. In 2018 we created a corporate area of Sustainability and Environment that aims the daily management of global/national climate agendas and its risks and opportunities. As a complement, Klabin presents a fixed sustainability committee composed of representatives of the organization's board of directors, whose objective is to discuss and insert issues related to sustainability (including climate change) in the organization's strategic planning. The sustainability and environment team is responsible for following the climate agendas and taking these issues to the decision making on the sustainability committee. In addition, the demands and decisions of this committee return the corporate team to operationalize and apply the actions to the environmental teams located in Klabin units. This ensures that issues related to our direct and indirect activities are tied to our climate change and organizational sustainability strategy. Cost of Management: BRL 45,736,382.04 which represents the total investment of Klabin SA in the year to environmental investments, including management, treatment of air emissions prevention costs and environmental management costs.

Em que ponto da cadeia de valor ocorre o fator de risco?

Cliente

Tipo de risco

Risco de parâmetro físico

Principal fator de risco relacionado ao clima

Crônicos: Elevação do nível do mar

Tipo de impacto financeiro

Redução na receita decorrente da diminuição na capacidade de produção (por ex., dificuldades de transporte, interrupções na cadeia de fornecimento)

Descrição específica da empresa

The sea level rise may paralyze ports used by Klabin (eg Port Region of Paranaguá in Paraná State), forcing the need to change the logistics process of the company (transportation of products, mainly from the Paraná units (Monte Alegre and PUMA). The forest department of Klabin constantly monitors the climatic conditions of the regions where Klabin act. This monitoring aims to assess trends at the acute and chronic levels of climate variables that may interfere in our operations. In addition, Klabin have direct contact with the port teams to assess the climatic conditions and possible future trends. As a control for possible risk of sea level rise or fall, Klabin maintains free spaces in the warehouse to receive the finished products even if there is a delay in loading due to climatic conditions. This information is important for the strategic planning of the organization and, in addition, in cases where more significant delays occur, the products can be stored in the free spaces in the warehouses located within each specific unit. In these warehouses, spaces are always available to receive products in abnormal process conditions, thus avoiding production unit stops. This contact with the port helps Klabin with the strategic sales organization of the products. If there is an occurrence that makes it impossible to access the port, the Klabin team can look for alternatives to export the materials (other ports, such as Itajaí or Santos port) and / or search for the market in the national market.

Explicação do valor do impacto financeiro

Estimated cost of BRL 5,053,798 per day related to non-disposal of Klabin's products in the port region of Paranaguá (Paraná) Considering the products that pass through the warehouse.

Método de gestão

The port terminal is responsible for the control and monitoring of the climatic and operational conditions of the terminal. Day-to-day there is direct contact between the port terminal and the Paranaguá depot (Paraná State) in relation to climatic conditions (temperature, wind conditions, sea level, among others) for cargo planning. Until now, there has been no need for change in the organization's planning because of sea level rising. But in case of occurrences, we can stock our products in our spaces available in the warehouse and, if necessary, transport the products to other terminals (for example, Santos / SP or Itajaí / SC). Cost of management: BRL 80,106.66 which represent the costs per day for operating the warehouse and transporting the materials to the port terminal. As a control for possible risk of sea level rise or fall, Klabin maintains free spaces in the warehouse to receive the finished products even if there is a delay in loading due to climatic conditions. This information is important for the strategic planning of the organization and, in addition, in cases where more significant delays occur, the products can be stored in the free spaces in the warehouses located within each specific unit. In these warehouses, spaces are always available to receive products in abnormal process conditions, thus avoiding production unit stops.

Política e juridicidade: Mandatos sobre e regulamentação de produtos e serviços existentes

Tipo de impacto financeiro

Aumento dos custos operacionais (por ex., custos de conformidade mais altos, aumento dos prêmios de seguro)

Descrição específica da empresa

New regulations for the use of renewable energies can generate needs for changes in the process and, consequently, an increase in operating costs. Due to its size, more than 70% of the fuel oil consumption is of the units of Klabin PUMA (39%), Monte Alegre (27%) and Correia Pinto (5%). New regulations related to the use of renewable energy can mainly increase the operational costs of these plants, requiring changes and investments in engineering for process and equipment changes.

Descrição específica da empresa

The PUMA unit, located in the municipality of Ortiguera (Paraná - Brazil), produces more energy from renewable sources than the demand of its production requires, allowing Klabin to make this surplus available to the market, generating income through the commercialization of a new product (Renewable Energy). In order to maintain this opportunity, in 2018 the PUMA unit was the first unit in the country's pulp sector to achieve ISO 50001 certification, attesting to the unit's efforts to improve its performance and energy efficiency

Explicação do valor do impacto financeiro

Approximately BRL 121,151,000.00 related to the sale of energy produced and not consumed by the PUMA unit in Paraná in 2018. Calculation is equal to the amount of renewable energy distributed to the national grid multiplied by the sales value in the year.

Estratégia para materializar a oportunidade

To manage this opportunity Klabin purchase energy from renewable resources. Its energy matrix includes natural renewable sources such as black liquor, biofuel, and hydro (own electrical power). At the end of 2013, 80% of the energy used by the company was generated by these sources. Every year, strategies, targets and effective actions are defined in all the industrial plants, in a quest for gains in energy efficiency. The year of 2014 made a progress in the works of the Puma Project, the most ambitious in our history, which made Klabin nearly double its size in a period of three years. The construction of this new pulp mill in Ortigueira (PR), has the production capacity of 1.5 million tons of pulp per year. It is worth to mention that the Ortigueira Plant, is able to generate more energy than it needs and the surplus is sold to the interconnected energy system (888,686.03 MWh). In order to maintain this opportunity, in 2018 the PUMA unit was the first unit in the country's pulp sector to achieve ISO 50001 certification, attesting to the unit's efforts to improve its performance and energy efficiency Cost to realize opportunity: BRL 41,768,243.41 in relation to the total cost of production of surplus energy sold in 2018 by PUMA (Paraná State), considering an average cost of 888,686.03MWh (amount of energy sold in 2018).

Descrição específica da empresa

Opp: Cap and trade schemes: CDM projects Voluntary commitments. Klabin has been participating in the permanent "Empresas Pelo Clima" (Companies for the Climate), which aims to mobilize, sensitize and articulate business leaders for the management and reduction of emissions of greenhouse gases (GHG), the management of climate risks and the proposal of public policies and positive incentives in the context of climate change. We are also currently participating in a Brazilian emission trading simulation system, which organizations can simulate the operation of a cap and trade system with respect to greenhouse gas emissions and removals. In this system we can simulate the purchase of carbon credits by the direct emissions of the organization and, in addition, simulate the sale of carbon credits related to the removal of CO₂ by our planted forests (8 million tons of CO₂ in 2018). This simulation applies to the entire business of Klabin S.A. This platform assists the organization in the understanding and taking of actions in cases of regulations related to this topic.

Explicação do valor do impacto financeiro

Annual financial positive implication: BRL minimum (413,511.98) and maximum (3,116,353,594.53) estimated. Rational: carbon removal credits (8,658,800.60 tons CO₂-eq from planted forests), minus the total GHG emissions (Scope 1+2) from the production process (756,743.491 tons CO₂-eq), multiplied by the minimum and maximum price per tonne of CO₂ on carbon credit market simulation in 2018 (Minimum = BRL 0.0523 /ton CO₂eq; Maximum = BRL 394.37/ton CO₂eq).

Estratégia para materializar a oportunidade

The recovering in the carbon market after COP21 (Paris, December 2015) and a recently approved Brazilian Law of Payment for Environmental Services will bring benefits and financial opportunities due to Klabin's forests. Currently, the company has 216 thousand hectares of preserved native woodlands in the Atlantic Rainforest. It is important to mention that Klabin is working on these opportunities with the realization of studies to valorize its biodiversity and its ecosystem services (such as the amount of CO₂ stored). Cost to realize opportunity: BRL 45,736,283.04 which represents the total investment of Klabin SA in the year to environmental investments, including management, treatment of air emissions prevention costs and environmental management costs.

Operações diretas

Tipo de oportunidade

Fonte de energia

Principal fator de oportunidade relacionada ao clima

Uso de fontes de energia com menor índice de emissões

Tipo de impacto financeiro

Redução dos custos operacionais (por ex., por meio do uso de abatimento com custo mais baixo)

Descrição específica da empresa

With PUMA unit located in the state of Paraná, the unit generates more energy from renewable sources than its production demand requires, allowing participation in renewable energy programs and adoption of energy efficiency measures. In 2018 the PUMA unit generated 888,686 MW of surplus energy, making this quantity available in the Brazilian National Interconnected System. This action reduces operating costs by increasing revenue from the sale of this energy, as well as providing energy from renewable sources contributing to a more renewable national energy matrix, aligning these actions with the UN Sustainable Development Goals. This surplus energy is sufficient to supply a city of approximately 500 thousand inhabitants.

Valor potencial do impacto financeiro (moeda)

117776714.47

Valor potencial do impacto financeiro – mínimo (moeda)

<Not Applicable>

Valor potencial do impacto financeiro – máximo (moeda)

<Not Applicable>

Explicação do valor do impacto financeiro

Estimated value referring to the quantity of fuel oil that the organization would stop consuming (replacing with fossil fuels) if there were regulations that demand the reduction of atmospheric emissions and increase of the clean matrix of fuels for generation of energy. This value only estimates the replacement of the fuel by another renewable source (biomass residues). This impact is considered medium-high, since the estimated specific cost difference for fuel use is different (specific cost of estimated fuel oil is more expensive than cost with biomass). It is important to mention that this estimated value does not consider the costs necessary to change technologies for fuel substitution. This calculation considers the replacement of the total consumption of fuel oil by the organization (98 thousand tons per year) for biomass waste to produce the same amount of energy (GJ), considering the specific cost of the oil in approximately BRL 1,200 per ton.

Estratégia para materializar a oportunidade

Klabin purchase energy from renewable resources. Its energy matrix includes natural renewable sources. At the end of 2013, 80% of the energy used by the company was generated by these sources. Every year, strategies, targets and effective actions are defined in all the industrial plants for gains in energy efficiency. 2014 made a progress in the works of the Puma Project, the most ambitious in our history, which made Klabin nearly double its size in a period of three years. It is worth to mention that the Ortigueira Plant, is able to generate more energy than it needs and the surplus is sold to the interconnected energy system. In order to maintain this opportunity, in 2018 the PUMA unit was the first unit in the country's pulp sector to achieve ISO 50001 certification, attesting to the unit's efforts to improve its performance and energy efficiency. Cost to realize opportunity: BRL 3,401,301.29 Estimated value representing the cost for the use of renewable fuel (biomass residue) in the replacement of fuel oil, not considering the need for replacement of new technology equipment An example of this opportunity was the replacement of fuel oil boilers by biomass boilers in the last 13 years in the Klabin units of Monte Alegre (PR), Otacílio Costa (SC), Correia Pinto (SC) and Angatuba (SP), reducing emissions of more than 100 thousand tons of CO₂eq

Produtos e serviços

Principal fator de oportunidade relacionada ao clima

Capacidade de diversificar as atividades de negócios

Tipo de impacto financeiro

Aumento da receita devidos à demanda por produtos e serviços com menor índice de emissões

Descrição específica da empresa

The PUMA unit, located in the municipality of Ortigueira (Paraná), produces more energy from renewable sources than demand for its production requires, allowing Klabin to generate International Renewable Energy Certificates (IRECs) for all the energy that was made available in the national system (888,686.03 MWh) To maintain this opportunity, in 2018 the PUMA unit was the first unit in the country's pulp sector to achieve ISO 50001 certification, attesting to the unit's efforts to improve its performance and energy efficiency. The I-REC Service is a global environmental energy attribute tracking system designed to facilitate reliable carbon accounting for Scope 2,

consistent with various international carbon accounting standards. For Klabin, registration at the I-REC Service is a way to obtain additional revenue from the sale of renewable energy certificates, contributing to a cleaner grid.

Explicação do valor do impacto financeiro

Approximately BRL 1,333,029.00 related to the sale of International Renewable Energy Certificates (IRECs) for all the energy that was made available in the national system (888,686.03 MWh) by PUMA unit. Calculation is equal to the amount of renewable energy distributed to the national grid multiplied by the IREC average sales value in the year. This impact is considered medium, since the sale of renewable energy certificates are considered as an additional revenue the main revenue obtained with the product "renewable energy" that is its sale and distribution with the national system.

Estratégia para materializar a oportunidade

To manage this opportunity Klabin energy matrix includes natural renewable sources such as black liquor, biofuel, and hydro (own electrical power). The year of 2014 made a progress in the works of the Puma Project, the most ambitious in our history, which made Klabin nearly double its size in a period of three years. The construction of this new pulp mill in Ortigueira (PR), has the production capacity of 1.5 million tons of pulp per year. It is worth to mention that the Ortigueira Plant, is able to generate more energy than it needs and the surplus is sold to the interconnected energy system. In order to maintain this opportunity, in 2018 the PUMA unit was the first unit in the country's pulp sector to achieve ISO 50001 certification, attesting to the unit's efforts to improve its performance and energy efficiency. Cost to realize opportunity: This value (BRL 368,982.44) refers to the total rate of emission of the renewable energy certificate per MWh sold (BRL 0.4152 / MW) multiplied by the total renewable energy sold by the PUMA unit in 2018 (888,686.03 mW)

Custo para materializar a oportunidade

368982.44

Comentários

This value (BRL 368,982.44) refers to the total rate of emission of the renewable energy certificate per MWh sold (BRL 0.4152 / MW) multiplied by the total renewable energy sold by the PUMA unit in 2018 (888,686.03 mW)

C2.5

| | Impacto | Descrição |
|---|---|--|
| Produtos e serviços | Impactado para alguns fornecedores, instalações ou linhas de produtos | So far, the organization understands that in the future (an estimate for the next 3 years) there may be changes in customer preferences that can lead to changes in the products and services provided. For example, increasing customer demand for ISO and FSSC-certified products in your production chain as a way to ensure the delivery of a quality and environmentally sound product. With this, Klabin has been developing new lines of monitoring and research and development for adequacy and innovation based on market trends. For example, the construction of the Klabin Technology Center in Telêmaco Borba (Paraná) is considered a positive impact for the organization, as it is taking the company's Research, Development and Innovation (R&D+I) activities to a new level studies and adaptations in renewable energies). The initiative was part of Klabin's three-year investment plan (2015 to 2017), which provides for the allocation of R \$ 70 million in R & D + I processes. Klabin understands that the magnitude of this impact for the organization is high, as the changes in preference for new products leads to new technologies on the part of the industry. To demonstrate the importance of this magnitude, it is important to mention the 12.5% acquisition of the Israeli startup Melodea Bio Based Solutions, a pioneer in the technology of extraction of nanocrystalline cellulose (CNC), produced 100% from renewable sources and, in addition, the announced the construction of the Pilot Plant Park in Paraná (investment of 32 million BRL), next to the recently inaugurated Technology Center, which will allow to simulate a manufacturing unit, where studies and tests will be carried out on research fronts such as microfibrillated cellulose , which will be incorporated into the company's paper production lines in the future, increasing the quality and strength of the products; and the launch of a specific paper card for the market of cup stock, the "Klacup". |
| Cadeia de fornecimento e/ou cadeia de valor | Impactado para alguns fornecedores, instalações ou linhas de produtos | To follow more closely the impacts of possible climate change on the growth of forest plantations, we have created a Department of Forestry Productivity and Ecophysiology, capable of simulating adverse scenarios and recommending appropriate actions. It is worth noting in 2018 the construction of a new laboratory in the Forest Research for the research activities in Ecophysiology, Soil and Forest Nutrition, creating synergy within the studies directed to the Forest Management of the company. In the case of our most extensive forest areas in the state of Paraná, the most predictable climate change has been the intensification of rainfall in the region, which would make management more difficult but, on the other hand, would benefit tree growth and planting. productivity. This action is directly related to the study of the risks related to the climate in the forest, industrial and logistic areas carried out by our teams. In order to demonstrate that Klabin considers the magnitude of the mentioned risks and opportunities important, we are investing new actions for monitoring and sustainability management in our supplier chain of Klabin SA in order to optimize our participation in our supply chain in issues related to sustainability (environment, climate change, labor ethics, social responsibility, among others). This is an investment with perspective of gradual growth over the years. The main benefits of this process for Klabin SA are the increase of the company's responsibility in the use of its resources, reduction of costs through collaborative actions (shared value), ease of access to capital and greater valuation, competitive advantage, better relationship with suppliers and engagement ODS 17 (Partnerships and Means of Implementation). |
| Atividades de adaptação e mitigação | Impactado | In order to follow the impacts of possible climatic risks more closely, we have created a Forestry Ecophysiology and Productivity Department, capable of simulating adverse scenarios and recommending appropriate actions. In the case of our most extensive forest areas in the state of Paraná, the most predictable climate change has been the intensification of rainfall in the region, which would make management more difficult but, on the other hand, would benefit tree growth and planting. productivity. This action is directly related to the study of the climate-related risks in the forest, industrial and logistic areas carried out in 2016 and was classified as medium magnitude impact. This was observed with simulations of climatic scenarios for the different regions of Brazil where there are Klabin units (all facilities were included in this study), pointing the climatic risks specific to each state from the present data for 2040 simulations. The steps and inputs of this study were separated into internal mapping (information gathering), climate modeling study, and identification of risks and opportunities. The major influences are in the units of the states of Santa Catarina, Paraná and São Paulo since the forest areas of the organization are in these states. As Klabin has more than 230,000 hectares of planted vegetation spread over a wide operating radius, the magnitude of this impact is considered to be medium, since it is a section of areas that can be impacted. One of the mitigation actions in 2018 was the allocation of resources to construction of a new laboratory in the Forest Research for the research activities in Ecophysiology, Soils and Forest Nutrition, creating synergy within the studies directed to the Forest Management of the company. In addition, in order to deal with these impacts, we have assigned a forest planning team to define the best operation logistics taking into account all possible aspects. With a broader and more strategic view, the R & D & I area acts in several links of the chain: - Improvement of planting and management processes to increase productivity; - Development of new products and improvements in processes to adapt them to customer needs or to better economic and environmental performance; |
| Investimento em P&D | Impactado | The Klabin Technology Center in Telêmaco Borba (Paraná) is considered to have a high positive impact on the organization, as it is taking the Research, Development and Innovation (R & D + I) activities of the company to a new level renewable). In addition, this allows us to develop new strategies for the organization: in 2013, the company began to study the most vulnerable aspects of its operations in relation to changing precipitation and temperature patterns, and the strength and constancy of the winds. The study results in internal action plans and proposals for adaptation measures aimed at preventing impacts on Klabin's operation (in forest and industrial units), as well as indications of possible external effects related to these climate changes, such as price and pressure on natural resources and their effects (for example, price of electricity). Potential short- and medium-term effects have already been added to the company's strategic planning (especially those requiring technological innovation to preserve forest growth) and are closely monitored by various groups, including the Sustainability Committee. One example of this is the creation of the Ecophysiology department responsible for monitoring current and future climate trends, such as changing precipitation patterns, winds and temperature, and anticipating possible impacts on forest productivity. The results of this analysis provide lines of action, for example, to the areas of R & D that become aware of the new developments or innovations they must pursue to address the threats and opportunities of Climate Change. In order to demonstrate that we consider this impact with high magnitude, besides the investment of R \$ 70 million between 2015 and 2017, Klabin will contribute about BRL 180 million in Industrial and Forestry Research in 2019-2021, including a new Pilot Plant fleet, aimed at developing new products. Klabin's area of Research, Development and Forest Innovation is based on the conduction of the projects inserted in different lines of research: Genetic Improvement; Forest Biotechnology, Phytosanitary Nutrition and Forestry; Ecofisiologia. |
| Operações | Impactado | In 2013, we began to study the most vulnerable aspects of its operations in relation to changes in precipitation and temperature patterns, and the strength and constancy of the winds. The study results in internal action plans and proposals for adaptation measures aimed at preventing impacts on Klabin's operation (in forest and industrial units), as well as indications of possible external effects related to these climate changes, such as price and pressure on natural resources. (for example, price of electricity). Potential short- and medium-term effects have already been added to the company's strategic planning (especially those requiring technological innovation to preserve forest growth) and are closely monitored, including the Sustainability Committee. In the case of our most extensive forest areas in the state of Paraná, the most predictable climate change has been the intensification of rainfall in the region, which would make management more difficult but, on the other hand, would benefit tree growth and planting. productivity. In order to demonstrate that we consider this impact with high magnitude, besides the investment of R \$ 70 million between 2015 and 2017, Klabin will contribute about BRL 180 million in Industrial and Forestry Research in 2019-2021, including a new Pilot Plant fleet, aimed at developing new products. So far, the operational costs with these impacts were not relevant, but the investments cited above reinforce the organization's preventive actions. |
| Outros, favor especificar | Não impactado | -x- |

C2.6

(C2.6) Descreva onde e como os riscos e oportunidades identificados foram levados em consideração no seu processo de planejamento financeiro.

| | Relevância | Descrição |
|-------------------------------|---|--|
| Receitas | Impactado | Possible benefits of the 100% clean energy matrix, carbon credits (high magnitude) and sale of renewable energy certificates. The recovery in the carbon market after COP21 (Paris, December 2015) and a recently approved Brazilian Environmental Payment Law may bring benefits and financial opportunities due to Klabin's native and preserved forests. Currently, the company has 216 thousand hectares of native forests preserved in the Atlantic Forest. In order to maintain these "medium-high" magnitudes as defined, in 2018 the PUMA unit was the first unit in the country's pulp sector to achieve ISO 50001 certification, attesting the unit's efforts to improve its performance and energy efficiency. For the sale of energy certificates, this impact is considered medium, since the sale of renewable energy certificates is considered as an additional revenue the main revenue obtained with the product "renewable energy" that is its sale and distribution with the national system. This sale has a magnitude of average to high, since it represents a financial impact of BRL 121,151,000.00 (2018). |
| Custos operacionais | Não impactado ainda | In the future (estimated time horizon of 5 years), a cap & trade scheme related to the imposition of a carbon price may affect the production of paper and pulp for the Klabin Units of Monte Alegre, Puma, Otacílio Costa, Correia Pinto and Angatuba, affecting directly in competitiveness by raising production costs. Also, any regulations related to fuel / energy consumption and the establishment of GHG emissions limits will be relevant for Klabin. While the company has been using more efficient technologies and equipment, it has adopted an increasingly cleaner matrix, and has high carbon stock and a great potential to generate new CO2eq credits. New regulations related to emissions limits will be relevant for Klabin. In 2016 Klabin developed, together with a company specialized in the theme, a study to define its risks related to climate change. The steps of this study were separated into internal mapping (information gathering and temporal alignment), climate modeling study and identification of risks and opportunities. After defining the risks, they were classified according to their reliability, magnitude and severity. One of the identified risks is regulatory risks, which indicate that the establishment of regulations related to fuel / energy consumption and the establishment of GHG emission limits are considered relevant for Klabin as they may lead to increased costs for operation of the whole organization. As a control, Klabin actively takes part in discussion, forums and workshops related to Climate Change challenges and its possible impacts on legislation (among others). Klabin is reference of public consults of carbon emissions and climate policies. The legislative proposals are done by APC Group, which represents Klabin and others companies. Klabin also has clear guidelines that orientates its activities planning and operations towards the management of Climate Change and its related regulations. Its pillars basically, relies on making constant improvements to make its operations more efficient in terms of emissions, the establishment of targets for GHG emissions and the assessment of business vulnerabilities in face of climate change. |
| Gastos/allocação de capital | Impactado | Klabin historically makes investments and encourages environmental and sustainability practices. Be it for controls and maintenance of operating systems as well as investments for research and development in the area. Based on this, the organization constantly maintains investments aimed at tracking trends and developing new technologies to improve environmental performance. For example, in 2018 Klabin invested about BRL 45,736,283.04 million for environmental investments, covering waste management, treatment of atmospheric emissions, costs of prevention and environmental management expenses. Also, the Klabin Technology Center in Telêmaco Borba (Paraná), is raising Research, Development and Innovation (R&D+I) activities in the company to a new level (including the renewable energy studies and adaptations). The initiative is part of Klabin's three-year investment plan (2015 to 2017), which provides for BRL 70 million to be allocated to R&D+I processes. In order to demonstrate that we consider this issue important, besides the investment of R \$ 70 million between 2015 and 2017, Klabin will contribute about BRL 180 million in Industrial and Forestry Research in 2019-2021, including a new Pilot Plant Park, aimed at developing new products. Klabin's area of Research, Development and Forest Innovation is based on the conduction of the projects inserted in different lines of research: Genetic Improvement; Forest Biotechnology, Phytosanitary Nutrition and Forestry; Ecofisiologia. |
| Aquisições e desinvestimentos | Impactado | Klabin has been developing new lines of monitoring and research and development for adequacy and innovation based on market trends. For example the construction of Klabin Technology Center in Telêmaco Borba (Paraná) is considered a high positive impact for the organization, since it is leading opportunities in Research, Development and Innovation (R&D+I) activities in the company to a new level (including the renewable energy studies and adaptations). The initiative is part of Klabin's three-year investment plan (2015 to 2017), which provides for BRL 70 million to be allocated to R&D+I processes. It is important to mention the 12.5% acquisition of the Israeli startup Melodea Bio Based Solutions, a pioneer in the technology of extraction of nanocrystalline cellulose (CNC), produced 100% from renewable sources and, in addition, the announced the construction of the Pilot Plant Park in Paraná (investment of 32 million BRL), next to the recently inaugurated Technology Center, which will allow to simulate a manufacturing unit, where studies and tests will be carried out on research fronts such as microfibrillated cellulose , which will be incorporated into the company's paper production lines in the future. Besides that, Klabin will contribute about BRL 180 million in Industrial and Forestry Research in 2019-2021, including a new Pilot Plant Park, aimed at developing new products. Klabin's area of Research, Development and Forest Innovation is based on the conduction of the projects inserted in different lines of research: Genetic Improvement; Forest Biotechnology, Phytosanitary Nutrition and Forestry; Ecofisiologia. |
| Acesso ao capital | Impactado | The organization understands that it is positively impacted in this aspect, since Klabin participates in the ISE (Business Sustainability Index), the ICO2 index, among other platforms that actively favor reallocation of investments in the organization, since participation in these platforms demonstrates transparency, concern and active work on issues related to corporate sustainability and preservation of the environment. In addition, Klabin considers this aspect as high magnitude. An example of this was that Klabin made a new issuance of green bonds in the amount of 500 million dollars and with a maturity of 30 years. This is the first time that a Brazilian company is able to raise funds from this category with this maturity. Green bonds are resources that companies seek in the market to finance their projects with a positive socio-environmental impact, such as those Klabin undertakes with mosaic forest management, biodiversity conservation, clean energy production and adequate waste disposal. To achieve this type of investment, companies need to demonstrate this commitment to sustainable principles and initiatives. |
| Ativos | Impactado para alguns fornecedores, instalações ou linhas de produtos | A positive item regarding investments for assets in the research and development of productive areas and environment is a construction of Klabin Technology Center. The Klabin Technology Center in Telêmaco Borba (Paraná), is raising Research, Development and Innovation (R&D+I) activities in the company to a new level (including the renewable energy studies and adaptations).The initiative was part of Klabin's three-year investment plan (2015 to 2017), which provides for BRL 70 million to be allocated to R&D+I processes. Besides that, Klabin will contribute about BRL 180 million in Industrial and Forestry Research in 2019-2021, including a new Pilot Plant Park, aimed at developing new products. In addition, the construction of a new plant (PUMA unit) with investment of more than BRL 8 billion, as well as the acquisition of new conversion units also demonstrates that the organization is seeking its growth in a planned and strategic way. Klabin also monitors market trends with regard to investments for sustainability and environmental developments. |
| Passivos | Não impactado | The organization has not yet been impacted by this item, however it is understood that this is a risk that must be managed in a rigorous and constant manner to ensure that there are no liabilities such as the need for investments for environmental adjustments and/or payment of legal sanctions. Such as the need to buy carbon credits due to increased atmospheric emissions due to new carbon pricing policies, which we estimate that this risk may occur in the next 3 years. For this, Klabin has environmental areas in each of its units, as well as a corporate environment and sustainability area (strategically located in the state of Paraná and close to Klabin's largest units (Puma, Monte Alegre, Otacílio Costa, Correia Pinto and Angatuba), which aims to carry out the daily monitoring and management of all items related to environmental issues and legality. Also, Klabin will continue to participate in initiatives such as "Companies for the Climate" (EPC – Empresas Pelo Clima) and participation in the committees representing our sector in Brazil, which aim to articulate business leaders for the management and reduction of greenhouse gas emissions, climate risks and the proposal of policies in the context of climate change and carbon pricing. |

C3.1a

(C3.1a) Sua organização usa a análise de cenários relacionados ao clima para informar sua estratégia de negócios?

Sim, qualitativa e quantitativa

(C-AC3.1b/C-CE3.1b/C-CH3.1b/C-CO3.1b/C-EU3.1b/C-FB3.1b/C-MM3.1b/C-OG3.1b/C-PF3.1b/C-ST3.1b/C-TO3.1b/C-TS3.1b) Indique se a sua organização desenvolveu um plano de transição para uma economia com baixos níveis de carbono em apoio à estratégia de negócios de longo prazo.

Sim

C3.1c

(C3.1c) Explique de que modo as questões relacionadas ao clima estão integradas em seus objetivos e estratégia de negócios.

Klabin has clear guidelines that orientates its activities planning and operations towards the management of Climate Change and its related issues. Its pillars, basically, relies on making constant improvements to make its operations more efficient in terms of emissions, the establishment of targets for GHG emissions and the assessment of business vulnerabilities in face of the Climate Change.

As Klabin presents a forest base of great representativeness for its business, besides being sensitive to the issues related to climate change, in 2013 the company started to study the most vulnerable aspects of its operations regarding change in rainfall and temperatures patterns, and strength and constancy of winds. The study results in internal action plans and proposals for adaptive measures aimed at to prevent impacts to Klabin's operation (in both forest and industry units), as well as indications on possible external effects related to these climate changes such as price and pressure on natural resources and its effects (e.g. price of electricity). The potential short and medium terms effects were already added to company's strategic planning (especially those ones which require technological innovation to preserve forests growth) and are closely monitored by multiple groups, including the Sustainability Committee.

In addition, as an example of a significant strategic decision for the organization, Klabin created the Klabin's Ecophysiology department, which is responsible for monitoring current and future trends of climate elements such as changing in rainfall, winds and temperature patterns and for anticipating possible impacts on the forest productivity. Results from this analysis provides lines of action, for instance, to the R&D areas which become aware of new developments or innovation that they must pursue in order to face Climate Change threats and opportunities.

The reduction of atmospheric emissions is also one of the commitments of the organization, inserted in its Sustainability Policy (item number 13 – "Ensure that the company's operations constantly seek to reduce emissions of greenhouse gases"). With the increase in the use of renewable fuel, the company contributes to reduce the emission of greenhouse gases (GHG). Indicators of this aspect are reported annually in the Emissions Inventory fulfilled according to the methodology of the Brazilian GHG Protocol program, a world recognized standard and audited by third party.

Klabin joins other organizations in implementing a global plan of action for people, the planet, peace and prosperity. The 17 Sustainable Development Goals (SDG) set out the global priorities and aspirations for 2030 and represent an opportunity to eliminate extreme poverty and put the world on a sustainable path. To implement this commitment, Klabin has developed new objectives and targets to incorporate both the issues that are relevant to its business and general issues of the global agenda into its Sustainability Strategy.

For several years, we have been committed to switching fossil fuel for biomass as an energy source. Klabin has an internal goal of maintaining at least 88% of its renewable energy matrix between 2018 and 2022. Several sources contribute to this cleaner matrix: in addition to biomass, we burn black liquor (a by-product of the industrial process) and use our own hydroelectric electricity.

Our concern with the climate change and the availability of abundant and clean energy extends to strategic decisions to the recently built Puma Unit in Ortigueira, PR.

With the stabilization of the industrial operations of the Puma Unit, inaugurated in 2016, Klabin registered evolution in the indicators related to energy. The unit was designed to be self-sufficient through the generation of energy from process residues, such as black liquor and biomass. As it produces more energy than it consumes, the company can make available the surplus for sale in the Brazilian Electric System, which contributes to the generation of revenue, while contributing to a cleaner energy matrix.

In 2018, Klabin consumed 68.331.658,31 GJ of energy in its operations. We reduced the consumption of non-renewable fuels for energy generation by 7%, mainly from actions to reduce the consumption of fuel oil (-12% compared to 2017) and diesel (-31% compared to 2017).

Since 2017, Klabin began to record part of the indirect emissions through the Approach based on the choice of purchase (Marketbased). In this approach Klabin quantifies GHG emissions of scope 2 using the specific emission factor associated with each source of electricity generation that Klabin has chosen to acquire. In this year 2018, Klabin acquired 696.089,40 MWh from hydroelectric generation, with the appropriate Declaration of the generator. This represent a 58% reduction of the Scope 2 emissions, when compared to the Location-based Approach, which uses the average emission factor of the SIN (National Interconnected System).

C3.1d

(C3.1d) Forneça detalhes do uso da análise de cenários relacionados ao clima por sua organização.

| Cenários relacionados ao clima | Detalhes |
|--------------------------------|---|
| RCP 2.6 | <p>Klabin developed, together with a company specialized in the theme, a study to define its risks related to climate change. The CMIP5 climate models were the main information base used in this study, with the description of the approximate horizontal resolutions and number of rounds of the future simulations (RCPs 2.6, 4.5, 6.0 and 8.5). These studies carried out simulations of climatic scenarios for the different regions of Brazil where there are Klabin units (all the facilities were included in this study), pointing out the climatic risks specific to each state from the present data to 2040 simulations. The steps and inputs of this study were separated into internal mapping (information gathering and temporal alignment), climate modeling study and identification of risks and opportunities. After defining the risks, they were classified according to their reliability, magnitude and severity. The results of the main risks (forestry, industrial and logistic) in this study were discussed by the steering committee, serving as a basis for the strategic planning of the organization and decision making on future scenarios. One of the risks mapped on Klabin's matrix, for example, is the increase in temperature and increase in the frequency of intense heat waves that can increase the growth of forest pests due to the increase of thermal stress on Klabin's plantations. Having a direct relationship in risk assessment of the organization, Klabin's area of Research, Development and Forestry Innovation is based on the conduction of the projects in different lines of research, such as Phytosanitary, Nutrition/Forestry and Ecophysiology. It is important to mention some highlights in 2018, such as the creation of the internal technical committee called FIR (Forest, Industry and Research), focused on understanding the quality characteristics of wood; the construction of a new laboratory in the Forest Research for the research activities in Ecophysiology, Soils and Forest Nutrition, creating synergism within the studies directed to the Forest Management of the company; Beginning of the creation of natural enemies in the laboratory and evaluation of its efficiency in controlling the main pests of Eucalyptus and Pinus. This Department of Forest Efficiency and Ecophysiology also monitors possible future climate scenarios, developing a modeling of data related to exposure to climatic parameters and assessing the impact of changes in planted forests, and recommends the necessary measures in case of adverse effects. As part of the expansion of the focus on Research, Development and Innovation to face a larger Klabin, the Company carries out a further investment cycle in the area. In addition to the investment of BRL 70 million between 2015 and 2017, Klabin will invest about BRL 180 million in Industrial and Forestry Research in the years 2019-2021. Also, Klabin joins other organizations in implementing a global plan of action for people, the planet, peace and prosperity. The 17 Sustainable Development Goals (SDG) set out the global priorities and aspirations for 2030 and represent an opportunity to eliminate extreme poverty and put the world on a sustainable path. To implement this commitment, Klabin has developed new objectives and targets to incorporate both the issues that are relevant to its business and general issues of the global agenda into its Sustainability Strategy. The company has a detailed array of climate opportunities and risks, including internal mapping of impacts already occurring due to climate events and major future risks and opportunities, as well as notes from the Climate Conference (COP) and the Intergovernmental Panel on Climate Change (IPCC).</p> |
| RCP 8.5 | <p>Klabin continues to conduct studies to assess its risks and opportunities. In 2018, we carried out a study comparing climate change in relation to forest management in the regions of Telêmaco Borba (PR), Otacílio Costa (SC) and Itapetininga (SP). This analysis of climatic variables used the climatic scenario RCP 8.5 based on the climatic history of the region (1981-2010), as well as evaluated reference scenarios on emissions of greenhouse gases for climate models - HadGEN2-ES. The climatologies for the reference period 1981 to 2010 were generated for the scenarios HadGEN2 of 2011-2020, 2021-2030 and 2031-2040. The main climatic risks evaluated were Quantity and frequency of intense drought, minimum temperature, average temperature, potential evapotranspiration and water deficit. Some of the results of this study show a general tendency of temperature increase in the study regions with mean increase of 0.32 °C per decade. Evaluating the impacts of the tendency of water deficit occurrence, it can be observed that the risks for the study regions (Telêmaco Borba and Otacílio Costa) are classified as low. Having a direct relationship in risk assessment of the organization, Klabin's area of Research, Development and Forestry Innovation is based on the conduction of the projects in different lines of research, such as Phytosanitary, Nutrition/Forestry and Ecophysiology. It is important to mention some highlights in 2018, such as the creation of the internal technical committee called FIR (Forest, Industry and Research), focused on understanding the quality characteristics of wood; the construction of a new laboratory in the Forest Research for the research activities in Ecophysiology, Soils and Forest Nutrition, creating synergism within the studies directed to the Forest Management of the company; Beginning of the creation of natural enemies in the laboratory and evaluation of its efficiency in controlling the main pests of Eucalyptus and Pinus. This Department of Forest Efficiency and Ecophysiology also monitors possible future climate scenarios, developing a modeling of data related to exposure to climatic parameters and assessing the impact of changes in planted forests, and recommends the necessary measures in case of adverse effects. As part of the expansion of the focus on Research, Development and Innovation to face a larger Klabin, the Company carries out a further investment cycle in the area. In addition to the investment of BRL 70 million between 2015 and 2017, Klabin will invest about BRL 180 million in Industrial and Forestry Research in the years 2019-2021. Also, Klabin joins other organizations in implementing a global plan of action for people, the planet, peace and prosperity. The 17 Sustainable Development Goals (SDG) set out the global priorities and aspirations for 2030 and represent an opportunity to eliminate extreme poverty and put the world on a sustainable path. To implement this commitment, Klabin has developed new objectives and targets to incorporate both the issues that are relevant to its business and general issues of the global agenda into its Sustainability Strategy. The company has a detailed array of climate opportunities and risks, including internal mapping of impacts already occurring due to climate events and major future risks and opportunities, as well as notes from the Climate Conference (COP) and the Intergovernmental Panel on Climate Change (IPCC).</p> |

C-AC3.1e/C-CE3.1e/C-CH3.1e/C-CO3.1e/C-EU3.1e/C-FB3.1e/C-MM3.1e/C-OG3.1e/C-PF3.1e/C-ST3.1e/C-TO3.1e/C-TS3.1e

Klabin has clear guidelines that orientates its activities planning and operations towards the management of Climate Change and its related issues. Its pillars, basically, relies on making constant improvements to make its operations more efficient in terms of emissions, the establishment of targets for GHG emissions and the assessment of business vulnerabilities in face of the Climate Change.

Klabin joins other organizations in implementing a global plan of action for people, the planet, peace and prosperity. The 17 Sustainable Development Goals (SDG) set out the global priorities and aspirations for 2030 and represent an opportunity to eliminate extreme poverty and put the world on a sustainable path. To implement this commitment, Klabin has developed new objectives and targets to incorporate both the issues that are relevant to its business and general issues of the global agenda into its Sustainability Strategy.

To reaffirm our commitment to implementing actions to combat climate change, Klabin is the first Brazilian company in the sector of forests, pulp and paper to be part of the "Companies Taking Action" initiative of the validation of our goals based on Science Based Targets.

Science-based targets provide companies with a clearly defined pathway to future-proof growth by specifying how much and how quickly they need to reduce their greenhouse gas emissions.

It is also worth to mention that, Klabin has restructured its team and created a specific corporate area of Sustainability and Environment that has as one of its objectives the day-to-day management of the issue with the responsibility of monitoring global and national climate agendas and mapping their related risks and opportunities.

The sustainability committee, which is made up of a representative of the board of directors, and aims to follow global and national climate agendas and map their related risks and opportunities in decision-making.

Since 2013, Klabin has been participating in the permanent "Empresas Pelo Clima" (Companies for the Climate), which aims to mobilize, sensitize and articulate business leaders for the management and reduction of emissions of greenhouse gases (GHG), the management of climate risks and the proposal of public policies and positive incentives in the context climate change.

For several years, we have been committed to switching fossil fuel for biomass as an energy source. Klabin has an internal goal of maintaining at least 88% of its renewable energy matrix between 2018 and 2022. Several sources contribute to this cleaner matrix: in addition to biomass, we burn black liquor (a by-product of the industrial process) and use our own hydroelectric electricity.

Our concern with the climate change and the availability of abundant and clean energy extends to strategic decisions to the recently built Puma Unit in Ortigueira, PR.

With the stabilization of the industrial operations of the Puma Unit, inaugurated in 2016, Klabin registered evolution in the indicators related to energy. The unit was designed to be self-sufficient through the generation of energy from process residues, such as black liquor and biomass. As it produces more energy than it consumes, the company can make available the surplus for sale in the Brazilian Electric System, which contributes to the generation of revenue, while contributing to a cleaner energy matrix.

In 2018, Klabin consumed 68.331.658,31 GJ of energy in its operations. We reduced the consumption of non-renewable fuels for energy generation by 7%, mainly from actions to reduce the consumption of fuel oil (-12% compared to 2017) and diesel (-31% compared to 2017).

Since 2017, Klabin began to record part of the indirect emissions through the Approach based on the choice of purchase (Marketbased). In this approach Klabin quantifies GHG emissions of scope 2 using the specific emission factor associated with each source of electricity generation that Klabin has chosen to acquire. In this year 2018, Klabin acquired 696.089,40 MWh from hydroelectric generation, with the appropriate Declaration of the generator. This represent a 58% reduction of the Scope 2 emissions, when compared to the Location-based Approach, which uses the average emission factor of the SIN (National Interconnected System).

By 2020, with the new growth projects of Klabin SA, we aim not to increase by more than 5% the emissions of scope 3 in relation to the base year of 2017. In this year 2018, we reduced the emissions of upstream diesel oil by 27% compared to 2017 from the optimization of the routes to transport raw material to the production units. In addition, Klabin is restructuring its supplier assessment process based on a new sustainability assessment in the organization's supply chain. We will do the gradual evaluation of suppliers and their results in sustainability, with the goal of together building new targets for, for example, reducing greenhouse gas emissions in the supply chain. To reaffirm our commitment to implementing actions to combat climate change, Klabin is the first Brazilian company in the sector of forests, pulp and paper to be part of the "Companies Taking Action" initiative of the validation of our goals based on Science Based Targets. Science-based targets provide companies with a clearly defined pathway to future-proof growth by specifying how much and how quickly they need to reduce their greenhouse gas emissions.

In 2017 Klabin S/A had as a goal the reduction of 1% of the emissions of the scope 1+2 reaching 205kg CO₂eq per ton of product. This goal was achieved, obtaining 193.53kg CO₂ eq per ton of product in this year of 2017. This demonstrates Klabin's commitment to reduce emissions of effect gases studied. With this, the targets set for 2018-2022 is 185 kg CO₂ eq per ton of product. Klabin started projects to reduce the consume of diesel and heavy oil in the pulp and paper mills. This project was started in 2004, when we changed a oil for natural GAS in Piracicaba unit. Then in 2008 we changed 2 to Heavy oil Boilers for a Biomass boiler in Monte Alegre Mill and did the same action in Otacilio Costa mill (2014), Correia Pinto mill (2012) and Angatuba mill (2015). With the improvements made in our processes, in 2018 we reached the target value until the year 2022, obtaining the result of 178.68 kgCO₂eq per ton of product. We reduced the consumption of non-renewable fuels for energy generation by 7%, mainly from actions to reduce the consumption of fuel oil (-12% compared to 2017) and diesel (-31% compared to 2017). To reaffirm our commitment to implementing actions to combat climate change, Klabin is the first Brazilian company in the sector of forests, pulp and paper to be part of the "Companies Taking Action" initiative of the validation of our goals based on Science Based Targets. Based on the results obtained in 2017, Klabin has set a reduction target of up to 5% between 2018 and 2022. In 2018 we reduced the purchase of electricity by 1%. This shows that the actions carried out in the units in relation to the awareness of the operational teams present positive results for the achievement of this goal. Also the period had the following highlights: We reduced the consumption of non-renewable fuels for energy generation by 7%, mainly from actions to reduce the consumption of fuel oil (-12% compared to 2017) and diesel (-31% compared to 2017). In 2019, the area of sustainability and environment is holding events called "For a Renewable Future" where actions are carried out to raise awareness of operational teams, improve the results of environmental indicators and actions for sustainability and business continuity.

Klabin is continually investing to raise the use of renewable sources in our energy matrix. In recent years it have progressively replaced fuel oil by biomass as fuel in our boilers, reaching in 2014 86,5% of renewable sources for energy generation. Our goal to 2022 is to increase this number and keep it at least to 88%. In 2018, Klabin increased the energy index from renewable sources to 89.12% and reduced its consumption of fossil fuels by 7% mainly from actions to reduce the consumption of fuel oil (-12% compared to 2017) and diesel (-31% compared to 2017). In 2019, the area of sustainability and environment is holding events called "For a Renewable Future" where actions are carried out to raise awareness of operational teams, improve the results of environmental indicators and actions for sustainability and business continuity.

In the Klabin Pilar unit, in 2018, we carried out the project of replacing all the lamps of the unit with led lamps and installed systems / sensors to control the intensity of illumination. The control system identifies the natural lighting of the environment and regulates the lamps according to the need for illumination that is lacking for this environment ("Smart Lighting" concept). This system generated the reduction of energy consumption by 72% in the unit. In addition to reducing energy consumption, this system reduced the unit's greenhouse gas emissions by 190 tonnes of CO₂eq in the year.

This project, carried out in the forest units of Paraná state, is named as the "Salvador", an equipment that operates installed in trucks that controls the rotation and speed of the vehicle in the best standard of efficient driving in regards to fuel economy. Even if the driver accelerates the vehicle, it limits the rotation by not letting it spend more fuel than is necessary. The main indicator evaluated is the increase in average productivity of drivers expressed in Km / L (vehicle autonomy). With the reduction of diesel oil consumption this project reduced greenhouse gas emissions (mobile combustion) by 920.43 tons of CO₂eq per year.

On Indirect GHG emissions from energy acquisition - Scope 2, in 2017 Klabin began to record these emissions through the Market-based Approach. In this approach Klabin quantifies GHG emissions of scope 2 using the specific emission factor associated with each source of electricity generation that Klabin has chosen to acquire. In this year 2018, Klabin acquired 696,089.40 MWh, from hydroelectric generation, with the proper Declaration of the generator. This results in a reduction of Scope 2 emissions in 51,342.53, when compared to location-based, which uses the average emission factor of the SIN (National Interconnected System). This demonstrates Klabin's commitment to opt for the purchase of renewable energy, in accordance with its Sustainability Policy. This initiative does not involve costs for the organization because these are declarations issued by the concessions that Klabin SA consume energy from renewable sources.

Por favor, explique

The greenhouse gas inventory calculation was based on the Brazilian GHG Protocol methodology. Klabin reserves more than 40% of its land for preserved native forests and maintains its own areas with planted forests for the manufacture of its products. Klabin was the first pulp and paper company in the Southern Hemisphere to obtain, in 1998, the Forest Stewardship Council®-FSC® certification (FSC-C022516) which attests to management practices that conserve natural resources, provide fair working conditions and encourage healthy relations with local communities. A pioneer in the adoption of mosaic planting concepts, Klabin has 239,000 hectares planted with pine and eucalyptus and 216,000 hectares of preserved native forests. For fire control, Klabin has an expert team to control through observation towers that use fire localization techniques by georeference and control charts. The team is made up of its own employees: 23 sentry towers, 18 forest lookouts, 26 night watchmen and 4 leaders are trained to detect any problems that occur in the company's assets. Klabin also adopts programs in order to improve the conditions of its areas, as well as to comply with environmental laws, the preservation and management of companies and plantations. Matas Legais - Developed in partnership with the Association of Preservation of Environment and Life (Apremavi), it promotes actions of rural property planning, conservation and environmental education in the states of Paraná and Santa Catarina. It guides small and medium-sized owners to perform more efficiently and with greater profitability, in addition to preserving ecosystems. Producers take courses, lectures and exchange visits and receive free seedlings of native plants. The program also encourages forestry with planted pine and eucalyptus forests, organic agriculture and ecotourism. This program had 59 new owners; 63,000 seedlings donated; 3,159.21 ha of demarcated areas of preservation. Using as base the value of 10.85 tCO2eq / ha calculated according to the CO2 sequestration of the native forests in relation to a total area that a Klabin has (Brazilian GHG Protocol Methodology used). As we have an amount in ha from Matas Legal we have: 3,159.21 ha * 10.85 tCO2 / ha = 34,263.5 tCO2eq

Since our raw material is our own forests, we have to maintain the great parameters of forest management. So, Klabin is a reference on particular areas preserved. 455,000 HECTARES OF OWN LAND: 239,000 hectares of planted forests and 216,000 hectares of preserved native forests and other third-part lands which has planted and preserved areas. Therefore, the company has the best numbers on Carbon Footprint. Using the methodology of the GHG Brazilian protocol and considering the scope 1, 2 and 3 of Klabin S.A we have the result of GHG emission intensity in 218.92 kgCO2eq / ton of product produced. On the other hand, if we consider all the carbon removal and storage of our natural and planted forests we have the result of intensity of 2,640.8 kgCO2eq /ton of product produced. We can conclude that Klabin has a significant carbon credit.

In this year of 2018 we reduced the consumption of non-renewable fuels for energy generation by 7%, mainly from constant actions to reduce the consumption of fuel oil (-12% in 2018 compared to 2017) and diesel (-31% in 2018, in relation to the previous year). We can also highlight the increase in hydroelectric power generation by 19%. These results demonstrate Klabin's commitment to increasingly search for sustainable solutions for the business. In 2018, we reduced absolute GHG emissions from scope 1 by 40,607.23 tCO₂eq over 2017. This represents a reduction of 10.47 kgCO₂eq for each ton of product produced.

In 2017, Klabin increased in 15% emissions from biomass, a renewable fuel that stands out positively. It is important to mention that, considering the emission values of scope 1 in intensity rate (kg CO₂e / ton produced) in relation to 2016, there was a reduction of 14.42 kgCO₂e / ton produced. In 2018, we reduced absolute GHG emissions from scope 1 by 40,607.23 tCO₂eq over 2017. This represents a reduction of 10.47 kgCO₂eq for each ton of product produced.

Estamos divulgando um valor de Escopo 2, com base no mercado

Comentários

On Indirect GHG emissions from energy acquisition - Scope 2, in 2017 Klabin began to record these emissions through the Market-based Approach. In this approach Klabin quantifies GHG emissions of scope 2 using the specific emission factor associated with each source of electricity generation that Klabin has chosen to acquire. In this year 2018, Klabin acquired 696,089.40 MWh, from hydroelectric generation, with the proper Declaration of the generator. This results in a reduction of Scope 2 emissions in 51,342.54, when compared to location-based, which uses the average emission factor of the SIN (National Interconnected System). This demonstrates Klabin's commitment to opt for the purchase of renewable energy, in accordance with its Sustainability Policy.

On Indirect GHG emissions from energy acquisition - Scope 2, in 2017 Klabin began to record part of these emissions through the Market-based Approach. In this approach Klabin quantifies GHG emissions of scope 2 using the specific emission factor associated with each source of electricity generation that Klabin has chosen to acquire. In this year 2017, Klabin acquired 674,320,073 MWh, from hydroelectric generation, with the proper Declaration of the generator, COPEL Geração e Transmissão SA. This results in a reduction of Scope 2 emissions, when compared to location-based, which uses the average emission factor of the SIN (National Interconnected System). This demonstrates Klabin's commitment to opt for the purchase of renewable energy, in accordance with its Sustainability Policy.

Matas Legais - Developed in partnership with the Association of Preservation of Environment and Life (Apremavi), it promotes actions of rural property planning, conservation and environmental education in the states of Paraná and Santa Catarina. It guides small and medium-sized owners to perform more efficiently and with greater profitability, in addition to preserving ecosystems. Producers take courses, lectures and exchange visits and receive free seedlings of native plants. The program also encourages forestry with planted pine and eucalyptus forests, organic agriculture and ecotourism. This program had 59 new owners; 63,000 seedlings donated; 3,159.21 ha of demarcated areas of preservation. Using as base the value of 10.85 tCO₂eq / ha calculated according to the CO₂ sequestration of the native forests in relation to a total area that a Klabin has (Brazilian GHG Protocol Metodology used). As we have an amount in ha from Matas Legal we have: 3,159.21 ha * 10.85 tCO₂ / ha = 34,263.5 tCO₂eq This amount of CO₂ is also contemplated in the CO₂ removal calculation for land use management

Menor

Por favor, explique

Timber is considered to be the main raw material for Klabin's production process. For the calculations of the atmospheric emissions of this commodity, the stationary emissions (plant residues and black liquor) are considered as biomass and liquor for the boilers (GHG emissions equivalent to 55,458.7 t CO₂e and 4,995,317.34 tCO₂ biogenic in 2018). That's a reduction of 5,2% of CO₂ emissions from timber when compared to 2017. It is important to mention that this reduction was not due to the increase in the use of non-renewable fuels. In this year of 2018 we also reduced the consumption of non-renewable fuels for energy generation by 7%, mainly from constant actions to reduce the consumption of fuel oil (-12% in 2018 compared to 2017) and diesel stationary (-31% in 2018, in relation to the previous year). These calculations are performed annually using the methodology of the Brazilian GHG Protocol.

C6.10

(C6.10) Descreva as emissões brutas totais de Escopos 1 e 2 combinados para o ano de referência (em toneladas métricas de CO2e), por receita total de unidade de moeda, e forneça as métricas de intensidade adicionais que são adequadas para suas operações de negócios.

Direção da variação

Diminuiu

Motivo da variação

Klabin had an emission rate for the year 2017 of 193.53 kgCO2 / t product. in this year 2018 with the operationalization of the PUMA unit which raised the level of sustainability of the organization, the results of detection rate reached the values of 178.67 kgCO2 / t product, approximately 8% lower than the result of the previous year. It is worth mentioning that the organization's goal was 1% (205 kgCO2 / t product). This reinforces the organization's commitment to its objectives and to the maintenance of corporate sustainability. In this year of 2018 we also reduced the consumption of non-renewable fuels for energy generation by 7%, mainly from constant actions to reduce the consumption of fuel oil (-12% in 2018 compared to 2017) and diesel stationary (-31% in 2018, in relation to the previous year). These calculations are performed annually using the methodology of the Brazilian GHG Protocol.

C7.9

(C7.9) Como o total de emissões brutas (Escopos 1 e 2 combinados) do ano de referência variou em comparação com o do ano de referência anterior?
Diminuiu

C7.9a

(C7.9a) Caso tenha ocorrido qualquer variação no total de emissões brutas (Escopos 1 e 2 combinados), identifique as razões dessa variação e compare cada uma delas com as emissões do ano anterior.

| | Mudança nas emissões (toneladas métricas de CO ₂ e) | Direção da variação | Valor das emissões (porcentagem) | Por favor, explique os cálculos |
|---|--|---------------------|----------------------------------|--|
| Mudança no consumo de energia renovável | 58644.86 | Diminuiu | 7.75 | In 2018, we reduced 58,654.657 tCO ₂ e related to scope 1 and 2 combined. It should be noted that this year, we reduced the consumption of non-renewable fuels for energy generation by 7%, mainly from constant actions to reduce consumption of fuel oil (-12% in 2018 compared to 2017) and diesel (-31% % in 2018, in relation to 2017). We can also highlight the increase in hydroelectric power generation by 19%. These results indicate an energy matrix of 89% from renewable sources. In addition, we highlight the 4% increase over the previous year in the amount of energy generated by the PUMA unit that was made available for sale, contributing to a more renewable national energy matrix. On Indirect GHG emissions from energy acquisition - Scope 2, in 2017 Klabin began to record these emissions through the Market-based Approach. In this approach Klabin quantifies GHG emissions of scope 2 using the specific emission factor associated with each source of electricity generation that Klabin has chosen to acquire. In this year 2018, Klabin acquired 696,089.40 MWh, from hydroelectric generation, with the proper Declaration of the generator. This results in a reduction of Scope 2 emissions in 51,342.53, when compared to location-based, which uses the average emission factor of the SIN (National Interconnected System). This demonstrates Klabin's commitment to opt for the purchase of renewable energy, in accordance with its Sustainability Policy. Escopo 1+2 = 756,743.49 tCO ₂ e Reduction compared to 2017 = 58,644.86 tCO ₂ e % = (58,644.86 / 756,743.49) * 100% = 7.75%. |
| Outras atividades de redução de emissões | 0 | Sem alteração | 0 | No change |
| Desinvestimentos | 0 | Sem alteração | 0 | No change |

| Mudança de limite | 0 | Sem alteração | 0 | No change |
| Mudança das condições físicas de operação | 1110.43 | Diminuiu | 0.15 | Project 1: In the Klabin Pilar unit, in 2018, we carried out the project of replacing all the lamps of the unit with led lamps and installed systems / sensors to control the intensity of illumination. The control system identifies the natural lighting of the environment and regulates the lamps according to the need for illumination that is lacking for this environment ("Smart Lighting" concept). This system generated the reduction of energy consumption by 72% in the unit. In addition to reducing energy consumption, this system reduced the unit's greenhouse gas emissions by 190 tonnes of CO ₂ eq in the year. Project 2: This project, carried out in the forest units of Paraná state, is named as the "Salvador", an equipment that operates installed in trucks that controls the rotation and speed of the vehicle in the best standard of efficient driving in regards to fuel economy. Even if the driver accelerates the vehicle, it limits the rotation by not letting it spends more fuel than is necessary. The main indicator evaluated is the increase in average productivity of drivers expressed in Km / L (vehicle autonomy). With the reduction of diesel oil consumption this project reduced greenhouse gas emissions (mobile combustion) by 920.43 tons of CO ₂ eq per year. Escopo 1+2 = 756,743.49 tCO ₂ e Reduction compared to 2017 = 1,110.43 tCO ₂ e % = (1110.43 / 756,743.49) * 100% = 0.15%. |

Comentários

The Brazilian GHG Protocol Methodology considers hydroelectric energy with emission factor equal to zero. In 2017 Klabin began to record these emissions through the Market-based Approach. In this approach Klabin quantifies GHG emissions of scope 2 using the specific emission factor associated with each source of electricity generation that Klabin has chosen to acquire. In this year 2018, Klabin acquired 696,089.40 MWh, from hydroelectric generation, with the proper Declaration of the generator. This results in a reduction of Scope 2 emissions in 51,342.53, when compared to location-based, which uses the average emission factor of the SIN (National Interconnected System). This demonstrates Klabin's commitment to opt for the purchase of renewable energy, in accordance with its Sustainability Policy.

In this year of 2018 we reduced the consumption of non-renewable fuels for energy generation by 7%, mainly from constant actions to reduce the consumption of fuel oil (-12% in 2018 compared to 2017) and diesel stationary (-31% in 2018, in 2017). These results indicate an energy matrix of 89.17% from renewable sources. This reinforces Klabin's commitment to constantly seek to increase the share of renewable sources in the energy matrix.

In 2018 we can highlight the reduction in the generation of non-hazardous waste destined for Landfill, as well as the percentage of hazardous waste generation that went from 0.24% in 2017 to 0.11% in 2018, showing the commitment of the company in achieving the goal of maintaining this number lower than 0.5%. In addition, we increased the waste recycling indicator from 91% (2017) to 92% (2018), reinforcing the commitment and focus on achieving the goal of maintaining waste reuse higher than 95% by 2022.

| C6. Dados das emissões | Verificação do impacto dos produtos | The product life cycle study was evaluated within the general guidelines for conducting Life Cycle Assessment studies established by ISO 14040 - Environmental Management - Life Cycle assessment - Principles and Framework and ISO 14044 - Environmental Management - Life Cycle Assessment - Requirements and Guidelines - (ISO, 2006a and ISO, 2006b). | Klabin performed the Life Cycle Analysis and calculated the carbon footprint for the company's 3 main products. These studies indicate that the amount of CO2 captured from the atmosphere during photosynthesis is greater than that emitted by Klabin's production process. We are currently carrying out new life cycle analysis studies to evaluate the paper produced by the organization, for the commercialized pulp which is produced in the PUMA unit and, in addition, we are conducting life cycle analysis studies for our industrial bags produced in the Lages unit. |

C11. Precificação do carbono

C11.1

(C11.1) Alguma (ou algumas) de suas operações ou atividades é regulamentada por um sistema de precificação do carbono (por ex., ETS, Cap & Trade ou Carbon Tax)?

Não, mas pretendemos ser regulamentados nos próximos três anos

C11.1d

(C11.1d) Qual a estratégia para atuar em conformidade com os sistemas de que a empresa participa ou pretende participar?

Klabin estimates that in the next three years carbon taxation may be a reality in the country. For this reason, Klabin currently takes part in an Emissions Trading System Simulation, organized by Business for the Climate (EPC) Platform, an initiative which assess market responses to carbon pricing. The company is using the experience in order to prepare itself, and engage with the market, to perspectives of carbon market recuperation and the resins prices recovering after COP21. Coalition Brazil Climate, Forests and Agriculture, initiative formed by businesses, civil society organizations and individuals interested in contributing to the national agenda on sustainable use of forests, sustainable agriculture and mitigation and adaptation to climate change in Brazil and in the world. Currently, the Coalition is promoting a dialogue between its participants, the federal government and the main international organizations related in order to contribute to the multilateral negotiations and economic agenda in the country. This methodology includes round tables, group dynamics and discussions in groups of different economy sectors.

Tipo de preço interno do carbono

Preço-sombra

Preço implícito

Compensações

Impacto e implicação

1 - shadow price: Due the possible impacts of the carbon regulation, for example tax or ETS, Klabin use a shadow price to understand the financial impact on the business revenue and EBITDA. We simulate that emissions from stationary sources (of our industrial units with annual emissions > 200.000 tonCO₂e) are regulated. Impact & implication We conducted 'sensitivity analysis' based on: Colombia carbon tax – US\$ 7,0. The carbon price is converted to Real. Our stationary emissions X medium carbon tax (R\$ 28,00) = around R\$ 10 million. This represents an impact around 1% on the EBITDA (R\$ 1,005 bi - 1T2019). 2 - MACC - Klabin has been structuring a Marginal Abatement Cost Curves to identify the cost of the technologies and reduction emission potential. Impact & implication The MACC contributes to understand better the cost effective emission abatement of the company, contributing to identify and prioritize the emission reduction measures. In some cases, the cost of possible carbon regulation (in Brazil) will enable some investments. In additional, some technologies measures offers economic gains. 3 - Offsets – the company has an offset project base on restoration areas with planted forest. This project was submitted to UNFCCC and Brazilian government. It is expected the negotiation these offsets in future carbon market in Brazil. A percentage of the offsets can be used as a flexible mechanism in the regulated market. Impact & implication An expected economic gain from sales of offsets, to identify this opportunity we use the currently offset price (\$ 3 = BRL 11,58) X 4.645.740 tCO₂e expected offsets (it will be generated) = around BRL 53 million.

C12. Engajamento

C12.1

(C12.1) Há engajamento da empresa com a cadeia de valor nas questões relacionadas ao clima?

Sim, com nossos fornecedores

Sim, com nossos clientes

% do total de gastos com aquisição (diretos e indiretos)

9.11

% de emissões de Escopo 3, conforme relatado em C6.5

100

Justificativa para a cobertura do engajamento

The percentage, in relation to the total number of suppliers active in Klabin S/A (6860 forest and industrial suppliers), is 8.38%. This calculation takes into account all suppliers regardless of the product supplied and/or their size. Thus, 575 suppliers of 6860 assets, represents 8.38% It is important to mention that, considering the forest area, this value is equal to 100%, that is, all suppliers are engaged by the organization. The suppliers that are contemplated in the projects are the suppliers and small farmers of the regions near the Klabin units. Mainly in the state of Paraná and Santa Catarina. The purpose of these investments is to carry out projects to promote rural property planning, conservation and environmental education in the states of Paraná and Santa Catarina. It guides small and medium-sized owners to perform more efficiently and with greater profitability, in addition to preserving ecosystems. The producers take courses, exchange talks and receive free seedlings of native plants. The program also encourages forestry with planted pine and eucalyptus forests, organic agriculture and ecotourism. In addition, it also aims to ally economic, social and environmental development by promoting the planting of pine and eucalyptus in idle areas of rural properties. In addition to the seedlings, Klabin provides the necessary guidance for correct land management. The process assists in the establishment of rural populations, promotes plant recovery and stimulates regional development.

Impacto do engajamento, incluindo as medidas de sucesso

The measure of success of all the engagement programs that are carried out by Klabin with its suppliers is linked to the monitoring of the occurrence of deviations from the sustainability criteria evaluated in suppliers. The program presents promising results, since to date the participants perform positive, and no occurrences are reported. All Klabin forest stewardship units are certified by the FSC®, To ensure that good management practices and a commitment to sustainable development are extended to the timber supply chain, Klabin has since 2013 maintained the Forest Certification Program for Small and Medium-sized Rural Producers in the region of Campos Gerais, Paraná, aimed at the producers that are part of the Programa de Fomento Florestal [Forest Development Program] and to independent producers. Certification is a statement that the timber producer operates with social and environmental responsibility and follows the worldwide standards of forest management. In addition, it contributes to the generation of product value and to the development of a market of greater added value. More than 25,000 hectares of properties had been certified and almost 7,000 hectares have already been environmentally restored in partner-producer areas. Thus, Klabin works together with its suppliers on an assessment of FSC controlled source wood. This work works with periodic follow-ups to address issues related to meeting legal requirements and environmental issues. The forest area develops a routine program of supplier audits to assess compliance with all FSC requirements, including issues of native forest preservation, which contributes to carbon sequestration. In addition to suppliers, there are carriers who also participate in engagement programs that assess issues related to climate change, such as preventive maintenance on equipment and monitoring of black smoke emitted by vehicles.

Comentários

Number of suppliers: 575 Considering an investment BRL 956 million invested in the year with respect to forestry activities, operational continuity reported in the summary of the organization's financial results in 2018.

% de fornecedores por número

1.5

% do total de gastos com aquisição (diretos e indiretos)

31

% de emissões de Escopo 3, conforme relatado em C6.5

100

Justificativa para a cobertura do engajamento

The percentage, in relation to the total number of suppliers active in Klabin S/A (6860 forest and industrial suppliers), is 1.5%. This calculation takes into account all suppliers regardless of the product supplied and/or their size. Thus, 103 suppliers of 6860 assets, represents 1.5%. In 2018, the supply chain and sustainability areas started the new supplier evaluation system. Starting in 2019, the reports will be carried out by an online platform and will be gradually selected the suppliers with potential environmental impact and greater annual expenditure. These evaluations of suppliers take into account all the pillars of sustainability, such as liability and labor law, business ethics, environment, among others. It is important to mention that this program of evaluating suppliers in execution presents a gradual planning of expansion. Therefore, in the coming years (2020 and 2021) we intend to increase the number of participants to 213 in the first year (representing 3.1% of suppliers and 69.44% of total spend) and 297 for the second year (representing 4.3% of suppliers and 80% of spend). This process demonstrates its success with the participating companies, obtaining notes above the minimum predicted value, as well as not presenting any sanction due to issues related to sustainability. After these years, the program will also present new plans for gradual expansion. This demonstrates Klabin's commitment to partnering with its supplier chain for joint growth in sustainability.

Impacto do engajamento, incluindo as medidas de sucesso

It is a solution that allows the monitoring of the environmental, social and ethical performance of the suppliers, formed by specialized software program and dedicated service to the data analysis of the supplier. This solution is integrated into Klabin's Supplier Management process, as one of the evaluation pillars, allowing to increase visibility into its supply chain and evolve its program to a level of excellence. This shared responsibility generates positive results as it also enables innovation from the supplier. The measures of success are punctuated by an evaluation of its pillars of environment, social, ethical and its chain of suppliers. Each evaluation item has specific weights (28% environmental, 36% social, 18% ethical and 18% supplier chain) where after the evaluation generates a general note of the partner. Results above 50 points indicate that the company presents understandable practices acceptable to the business.

Comentários

Number of suppliers for the first year: 103 Considering an investment BRL 956 million invested in the year with respect to forestry activities, operational continuity reported in the summary of the organization's financial results in 2018.

C12.1b

(C12.1b) Forneça detalhes de sua estratégia de engajamento com os clientes nas questões relacionadas ao clima.

Tipo de engajamento

Compartilhamento de aprendizado/informações

Detalhes do engajamento

Compartilhar informações sobre seus produtos e esquemas de certificação relevantes (por ex., Energy STAR)

% de clientes por número

100

% de emissões de Escopo 3, conforme relatado em C6.5

100

Por favor, explique a justificativa para selecionar este grupo de clientes e o escopo do engajamento

Klabin shares information with all its customers regarding information related to the organization's atmospheric emissions and certifications. There are some specific customers where Klabin periodically responds to information on air emissions, sustainability and the environment. In addition, for all customers (and for this reason it is considered 100%), Klabin publicly announces its results and actions related to climate change. Some of the shared documents are: Public record of atmospheric emissions, disclosure of results on the Klabin website, Corporate Sustainability Index Report (ISE), Klabin Sustainability Report, Dow Jones Report, among others.

Impacto do engajamento, incluindo as medidas de sucesso

Impact measurement with information sharing is related to the grades obtained in completed forms for the specific customers. In addition, the main indicator is the loss of customers due to environmental issues. For the first item, Klabin has a maximum rating on all completed customer forms. For the second item, the impact of success is 100%, since there were no losses of customers of Klabin for environmental reasons.

C12.1c

(C12.1c) Forneça detalhes de sua estratégia de engajamento com outros parceiros da cadeia de valor nas questões relacionadas ao clima.

Klabin develops practices of adequacy, conservation and environmental preservation in rural properties.

We adopt programs and play the role of its region in order to improve the conditions of its stakeholders, as well as to comply with environmental laws, the preservation and management of companies and plantations. These initiatives are applied to small and medium-sized owners who are not necessarily Klabin suppliers.

The main programs are: Matas Legais - Developed in partnership with the Association of Preservation of Environment and Life (Apremavi), it promotes actions of rural property planning, conservation and environmental education in the states of Paraná and Santa Catarina. It guides small and medium-sized owners to perform more efficiently and with greater profitability, in addition to preserving ecosystems. Producers take courses, lectures and exchange visits and receive free seedlings of native plants. The program also encourages forestry with planted pine and eucalyptus forests, organic agriculture and ecotourism.

Planning for Sustainable Properties (Matas Sociais) - This program has been developed since August 2015 in partnership with APREMAVI, TNC and SEBRAE, to promote the economic, environmental and social strengthening of small and medium-sized rural properties. It develops actions that assist the producer in the environmental, legal and landscape adaptation of the property, in the planning and diversification of the production, strengthening initiatives of association and cooperativism, and facilitating the access to the new opportunities of market and regional development.

The implementation of these programs in 2018 for small and medium-sized producers located in the forest areas near the Klabin units in the state of Paraná and Santa Catarina generated positive results. For Matas legais program, we had 59 new partners, we also donated 63,000 seedlings to help in the regularization of preservation areas in these properties and also 3,159 ha of demarcated areas of preservation. The result of this action is the strengthening of the partnership between Klabin and the community, and the environmental regularization of the properties of these small and medium producers in the forest regions.

It is also important to mention that this program reduced greenhouse gas emissions in 34,263.5 tCO2eq using as base the value of 10.85 tCO2eq / ha calculated according to the CO2 sequestration of the native forests in relation to a total area that a Klabin has (Brazilian GHG Protocol Methodology used).

For the Planning Sustainable Properties (Matas Sociais) program, we serve 436 rural properties which Klabin helps with the diversification of its properties, generating extreme income from these producers in the field.

C12.3a

(C12.3a) Em quais aspectos a empresa está engajada diretamente com os formuladores de políticas públicas?

| Foco em legislação | Posição corporativa | Detalhes do engajamento | Solução legislativa proposta |
|--|-----------------------------|---|---|
| Reporte obrigatório de emissões de carbono | Apoio com pequenas exceções | Klabin's report is based on The Greenhouse Gas Protocol (GHG Protocol) which is the most widely used international accounting tool for government and business leaders to understand, quantify, and manage greenhouse gas emissions. Furthermore, Klabin takes part on the EPC - Empresas pelo Clima (Companies for the Climate) a platform which mobilizes, raises awareness and influences business leaders to manage and reduce greenhouse gas emissions, manage climate risks and propose public policies and positive incentives in the context of climate change. Also, Klabin takes part of the Coalition Brazil Climate, Forests and Agriculture, initiative formed by businesses, civil society organizations and individuals interested in contributing to the national agenda on sustainable use of forests, sustainable agriculture and mitigation and adaptation to climate change in Brazil and in the world. Currently, the Coalition is promoting a dialogue between its participants, the federal government and the main international organizations related in order to contribute to the multilateral negotiations and economic agenda in the country. The minor exceptions refers to GHG Protocol methodology which currently considers only emissions, not including removals by sinks. | In reason of this programs, Klabin is reference of public consults of carbon emissions and climate policies. The legislative proposes are done by EPC Group, which represents Klabin and others companies. EPC promotes debates between member companies and the government, in order to enable the private sector collaboration in the building of public policies for a low-carbon economy in Brazil; creation of a first-of-its-kind collaboration network and building of best practices to manage GHG emissions among EPC members and partners; and participation in the Corporate Leaders Network for Climate Action (CLN) international network. In 2009, a significant group of Brazilian business people willing to encourage a low-carbon economy in the country and help build a new sustainable development framework got together and created the Business for the Climate (EPC) Platform, a continuous Brazilian business platform for the transition towards a low-carbon economy.Launched in partnership with The Prince of Wales Corporate Leaders Group on Climate Change (CLG), and with the support of 27 Founding Companies, EPC currently counts with the participation of 36 Member Companies. Its goals are: mobilize, engage and involve corporate leaderships for managing and reducing GHG emissions, managing climate risks, and suggesting public policies and positive incentives in the context of climate change.Considered the next step after Brazil GHG Protocol Program, EPC engages companies not only in discussions and activities related to management and reduction of corporate GHG emissions, but also in the industry positioning when it comes to climate and elaboration of public policy propositions to contribute to a low-carbon economy in Brazil.Klabin is one of the 5 principal particular areas planted and preserved in Brazil, so its represents the importance of our forest management in the country when the Coalition Brazil Climate, Forests and Agriculture was created. |
| <i>Cap and Trade</i> | Apoio | Klabin takes part, for the fourth year, in an Emissions Trading System Simulation, performed by EPC - Empresas pelo Clima (Companies for the Climate) which aims to assess market responses in carbon pricing looking toward a new Cap and trade market. | Promoted by EPC in partnership with Rio de Janeiro Green Stock Exchange (BVRio), the purpose of this simulation is to provide the business sector with a realistic and hands-on experience on how a 'cap-and-trade' system works. The simulation foundations were built throughout 2013 through a joint process with EPC member companies, inspired by similar - real and simulated - experiences, in a number of countries and regions worldwide. It is worth mentioning, however, that in early 2015 Klabin established a Climate Committee: working group responsible for assessing the Global Climate agenda evolution and for interpreting its implications (risks and opportunities) for the company's operations. With representatives from various areas of the company and with the support of an external expert, the challenge proposed to the committee is to align internal action and goals with those set by global Climate science. In 2016 and 2018, we did a complex study of climate vulnerabilities which is on use to develop your strategy to manage this subject in the whole company. |
| Eficiência energética | Apoio | Klabin's report is based on The Greenhouse Gas Protocol (GHG Protocol) which is the most widely used international accounting tool for government and business leaders to understand, quantify, and manage greenhouse gas emissions. Furthermore, Klabin takes part on the EPC - Empresas pelo Clima (Companies for the Climate) a platform which mobilizes, raises awareness and influences business leaders to manage and reduce greenhouse gas emissions, manage climate risks and propose public policies and positive incentives in the context of climate change. Currently, the Coalition is promoting a dialogue between its participants, the federal government and the main international organizations related in order to contribute to the multilateral negotiations and economic agenda in the country. | In reason of this programs, Klabin is reference of public consults of carbon emissions and climate policies. The legislative proposes are done by EPC Group, which represents Klabin and others companies. EPC promotes debates between member companies and the government, in order to enable the private sector collaboration in the building of public policies for a low-carbon economy in Brazil; creation of a first-of-its-kind collaboration network and building of best practices to manage GHG emissions among EPC members and partners; and participation in the Corporate Leaders Network for Climate Action (CLN) international network.In 2009, a significant group of Brazilian business people willing to encourage a low-carbon economy in the country and help build a new sustainable development framework got together and created the Business for the Climate (EPC) Platform, a continuous Brazilian business platform for the transition towards a low-carbon economy.Launched in partnership with The Prince of Wales Corporate Leaders Group on Climate Change (CLG), and with the support of 27 Founding Companies, EPC currently counts with the participation of 36 Member Companies. Its goals are: mobilize, engage and involve corporate leaderships for managing and reducing GHG emissions, managing climate risks, and suggesting public policies and positive incentives in the context of climate change.Considered the next step after Brazil GHG Protocol Program, EPC engages companies not only in discussions and activities related to management and reduction of corporate GHG emissions, but also in the industry positioning when it comes to climate and elaboration of public policy propositions to contribute to a low-carbon economy in Brazil.Klabin is one of the 5 principal particular areas planted and preserved in Brazil, so its represents the importance of our forest management in the country when the Coalition Brazil Climate, Forests and Agriculture was created. |
| Geração de energia limpa | Apoio | Klabin's report is based on The Greenhouse Gas Protocol (GHG Protocol) which is the most widely used international accounting tool for government and business leaders to understand, quantify, and manage greenhouse gas emissions. Furthermore, Klabin takes part on the EPC - Empresas pelo Clima (Companies for the Climate) a platform which mobilizes, raises awareness and influences business leaders to manage and reduce greenhouse gas emissions, manage climate risks and propose public policies and positive incentives in the context of climate change. | Klabin is reference of public consults of carbon emissions and climate policies. The legislative proposes are done by EPC Group, which represents Klabin and others companies. EPC promotes debates between member companies and the government, in order to enable the private sector collaboration in the building of public policies for a low-carbon economy in Brazil; creation of a first-of-its-kind collaboration network and building of best practices to manage GHG emissions among EPC members and partners; and participation in the Corporate Leaders Network for Climate Action (CLN) international network.Launched in partnership with The Prince of Wales Corporate Leaders Group on Climate Change (CLG), and with the support of 27 Founding Companies, EPC currently counts with the participation of 36 Member Companies. Such efforts aim at contributing to: Strengthening competitiveness in the domestic industry in a new global economic context Ensuring access of Brazilian products to international markets, which are increasingly demanding in socio-environmental standards Building a domestic market that is keen on technology development, innovation and business practices, with lower potential to release GHG Promote energy security in Brazil.For several years, we have been committed to switching fossil fuel for biomass as an energy source. In 2018, 89% of our energy was generated from renewable resources. |

C12.3b

(C12.3b) A empresa faz parte do Conselho de alguma associação comercial ou oferece, além da taxa de associação, outro tipo de apoio financeiro?

Sim

C12.3c

(C12.3c) Insira os detalhes sobre as associações comerciais que estão mais propensas a posicionar-se sobre legislação na área de mudanças climáticas.

Associação comercial

EPC (Empresas pelo Clima) - literal translation to Companies For Climate

A posição da sua empresa em relação às mudanças climáticas é consistente com a dessas associações?

Consistente

Por favor, explique o posicionamento da associação comercial

The Empresas pelo Clima (Companies for Climate) is a permanent business platform, which aims to mobilize and raise awareness on business leaders to manage and reduce GHG emissions, the climate risks management and policy building and positive incentives in the context of climate change. EPC promotes debates between member companies and the government, in order to enable the private sector collaboration in the building of public policies for a low-carbon economy in Brazil; creation of a first-of-its-kind collaboration network and building of best practices to manage GHG emissions among EPC members and partners; and participation in the Corporate Leaders Network for Climate Action (CLN) international network. Based on EPC activities, Brazilian businesspeople assess their risks and opportunities and jointly discuss practical solutions and contributions to a legal framework in the country. Such efforts aim at contributing to: Strengthening competitiveness in the domestic industry in a new global economic context.

Como você tentou ou está tentando influenciar a posição?

Klabin actively takes part in discussion, forums and workshops aimed at Climate Change challenges and its possible impacts on legislation (among others). Klabin is reference of public consults of carbon emissions and climate policies. The legislative proposes are done by EPC Group, which represents Klabin and others companies.

Associação comercial

Coalition Brazil Climate, Forests and Agriculture

A posição da sua empresa em relação às mudanças climáticas é consistente com a dessas associações?

Consistente

Por favor, explique o posicionamento da associação comercial

Coalition Brazil Climate, Forests and Agriculture, initiative formed by businesses, civil society organizations and individuals interested in contributing to the national agenda on sustainable use of forests, sustainable agriculture and mitigation and adaptation to climate change in Brazil and in the world. Currently, the Coalition is promoting a dialogue between its participants, the federal government and the main international organizations related in order to contribute to the multilateral negotiations and economic agenda in the country.

Como você tentou ou está tentando influenciar a posição?

Klabin is one of the 5 principal particular areas planted and preserved in Brazil, so its represents the importance of our forest management in the country.

C12.3d

(C12.3d) A empresa divulga uma lista com todas as organizações de pesquisa que financia?

Sim

C12.3e

(C12.3e) Forneça detalhes sobre as outras atividades de engajamento empreendidas.

Coalition Brazil Climate, Forests and Agriculture, initiative formed by businesses, civil society organizations and individuals interested in contributing to the national agenda on sustainable use of forests, sustainable agriculture and mitigation and adaptation to climate change in Brazil and in the world. Currently, the Coalition is promoting a dialogue between its participants, the federal government and the main international organizations related in order to contribute to the multilateral negotiations and economic agenda in the country. Also, Klabin takes part in an Emissions Trading System Simulation, performed by EPC - Empresas pelo Clima (Companies for the Climate) which aims to assess market responses in carbon pricing looking forward a new vision of carbon market. This methodology includes round tables, group dynamics and discussions in groups of different economy sectors.

C12.3f

(C12.3f) Quais os processos adotados para garantir que todas as atividades diretas e indiretas da empresa, que influenciam a política, sejam consistentes com a estratégia global de mudanças climáticas?

Klabin has restructured its team and created a specific corporate area of Sustainability and Environment that has as one of its objectives the day-to-day management of the issue with the responsibility of monitoring global and national climate agendas and mapping their related risks and opportunities related to all of the Klabin units. This team is responsible for operating and managing corporate issues related to the environment and sustainability in the organization.

As a complement to the inclusion of the activities of this corporate team, Klabin presents a fixed sustainability committee made up of representatives of the organization's board of directors whose objective is to discuss and insert sustainability-related issues (including climate change) into the organization's strategic planning.

The corporate sustainability and environmental team is responsible for following the demands of global and national climate agendas and mapping their related risks and opportunities and taking these issues to decision making in the sustainability committee.

In addition, the demands and decisions of this committee return the corporate team to operationalize and apply the actions together with the environmental teams located in Klabin units. This ensures that the issues related to our direct and indirect activities are linked to our strategy of climate change and organizational sustainability.

The success of this management model is ensured by a governance structure that involves all levels of the company, constantly interacting with each other and empowering all Klabin's areas and employees.

This is the organization's sustainability report. The document presents the main information on the company's performance and management practices in the environmental, social and economic fields in the last year. The content was organized based on the correspondence between the nine themes most relevant to the business, pointed out in a materiality study carried out with Klabin's stakeholders and subsequently related to the United Nations (UN) Sustainable Development Goals (SDG). Since 2016, Klabin has voluntarily joined the SDG. This broad action plan, which engages diverse sectors of global society, assumes that solutions, technologies and business processes can be applied to address the major global challenges of sustainable development. In order to implement its commitment to the ODS, Klabin has supplemented its sustainability policy and assumptions to cover all these issues.

This is the report for the Public Register of Emissions. This registry is a platform developed by the Brazilian GHG Protocol Program that assists in the publication of the inventories of greenhouse gas (GHG) emissions from member organizations of the Program. It is currently the largest database of corporate inventories in Latin America. Klabin has been participating in the program and has been publicly recording its emissions since 2010.

Descrição do impacto

Klabin adopts programs and plays the role of its suppliers and its region owners in order to improve the conditions of its stakeholders, as well as to comply with environmental laws, the preservation and management of companies and plantations. The main programs are: Matas Legais - Developed in partnership with the Association of Preservation of Environment and Life (Apremavi), it promotes actions of rural property planning, conservation and environmental education in the states of Paraná and Santa Catarina. It guides small and medium-sized owners to perform more efficiently and with greater profitability, in addition to preserving ecosystems. Producers take courses, lectures and exchange visits and receive free seedlings of native plants. The program also encourages forestry with planted pine and eucalyptus forests, organic agriculture and ecotourism. Fomento Florestal [Forest Development] - economic, social and environmental development by promoting the planting of pine and eucalyptus in idle areas of rural properties. In addition to the seedlings, Klabin provides the necessary guidance for correct land management. The process assists in the establishment of rural populations, promotes plant recovery and stimulates regional development. Planning for Sustainable Properties (Matas Sociais) - This program has been developed since August 2015 in partnership with APREMAVI, TNC and SEBRAE, to promote the economic, environmental and social strengthening of small and medium-sized rural properties. It develops actions that assist the producer in the environmental, legal and landscape adaptation of the property, in the planning and diversification of the production, strengthening initiatives of association and cooperativism, and facilitating the access to the new opportunities of market and regional development.

|---------|---|--------------------------------------|
| Linha 1 | INDUSTRIAL TECHNOLOGY, INNOVATION, SUSTAINABILITY AND PULP BUSINESS OFFICER | Diretor do Conselho |

SC. Módulo de cadeia de fornecimento

SC0.0

(SC0.0) Se preferir, forneça uma introdução separada para este módulo.

Klabin is the Brazilian largest paper producer and exporter. Is considered the leader in the production of papers and cartons for packaging, corrugated packaging and industrial bags, and markets timber in logs. It is also the only Brazilian company to simultaneously supply hardwood pulp (eucalyptus), softwood pulp (pine) and fluff pulp to the market.

Founded in Brazil in 1899, currently has 18 industrial units, with 17 units distributed in eight Brazilian states and one in Argentina. Klabin also has commercial offices in eight Brazilian states, a branch office in the United States, Austria, and sales representatives and agents in many countries.

The paper and paperboard for packaging manufactured, as well as corrugated board packaging and industrial bags offer protection and safety to foods, beverages, hygiene and cleaning products, electronics and consumer appliances, cement, seeds, wheat flour, chemical products and other items. These products are a measure of how Klabin is present in the people's daily lives.

Hardwood and softwood pulp, used individually or together as a mix, give the essential characteristics to diverse types of paper: the ideal level of strength, softness and absorption for hygiene products, strength and opacity for printing and writing paper, and other specific properties required for specialty papers.

We are a world reference in sustainable development. Our forestry and industrial activities are based on this concept to preserve the biodiversity and the ecological balance of the ecosystems of the regions where we operate. Our Sustainability policy integrates the entire production chain to offer the market a responsible product with the environment and in line with the UN Sustainable Development Goals.

Since 2014, Klabin has been part of the Corporate Sustainability Index (ISE) of the BM&FBovespa. In addition, we are also a signatory to the United Nations Global Compact and the Brazilian Pact to Eradicate Slave Labor, and look for suppliers and business partners that adopt the same values of ethics, transparency and respect for the principles of sustainability.

Klabin reserves **43%** of its land for preserved native forests (48% of total forest areas). In addition, it maintains its own areas with planted forests for the manufacture of its products. A pioneer in adopting the concept of sustainable development, Klabin was the **first** pulp and paper company in the Southern Hemisphere to obtain, in 1998, the Forest Stewardship Council®-FSC® certification which attests to management practices that conserve natural resources, provide fair working conditions and encourage healthy relations with local communities. A pioneer in the adoption of mosaic planting concepts (a system that intermingles preserved native forests with planted forests) in its forestry management, Klabin has **239,000 hectares** planted with pine and eucalyptus and **216,000 hectares** of preserved native forests.

Since 2013, Klabin has been participating in the permanent "Empresas Pelo Clima" (Companies for the Climate), which aims to mobilize, sensitize and articulate business leaders for the management and reduction of emissions of greenhouse gases (GHG), the management of climate risks and the proposal of public policies and positive incentives in the context climate change.

In 2017, "Guia Exame de Sustentabilidade" elected Klabin the Most Sustainable Company in the Pulp and Paper Sector. The Guide is one of the most relevant publications on sustainability in the market.

Klabin also achieved a high level of performance by achieving 100% performance in Responsible Fiber Supply in the Environmental Index of Paper and Pulp Companies - Environmental Paper Company Index 2017 (EPCI), held every two years by WWF.

Respect for communities is a guiding value of Klabin in all the regions where it operates. Having clear governance criteria, providing transparency to all its acts and promoting the engagement of local stakeholders are the company's constant concerns in managing the social impacts of its activities.

Klabin invests in the territory so that all population benefits from initiatives in the areas of local development, education, culture and environmental education. For its employees, it offers programs that include personal development and volunteer activities.

An example is the Matas Sociais Program (Planning Sustainable Properties) where Klabin assists family farmers in sustainable planning and diversification of land use. It encourages family farming, development of the production and consumption chain and entrepreneurship. It has the partnership of the Brazilian Service of Support to Micro and Small Businesses (Sebrae), the international organization The Nature Conservancy (TNC) and Apremavi. The initiative has already benefited more than 400 properties.

The company creates **19,000** jobs (direct and indirect) and invests regularly in people development to promote competencies specific to its business, well-being and safety.

Principais fontes de emissões

This is the specific CO2 emissions (ton CO2e / ton of product) for Klabin S.A products scope 1 using the Brazilian GHG methodology. This allocation result is based on the specific emission of CO2e for each ton of product supplied to the customer in 2018. Thus, total CO2e emissions are composed of the multiplication between the reported value of emissions by the total quantity of product supplied to the customer. 72% of the emissions of CO2e of scope 1 come from the category of stationary combustion for power generation and 25% of the emissions of this scope are of the category of mobile combustion related to the transport of raw material and use of light vehicles for displacement. The remainder (0.5%) are emissions related to the other categories of scope 1 (fugitive emissions, industrial processes, among others). It is important to mention that in this year 2018 we reduced the consumption of non-renewable fuels for energy generation by 7%, mainly from constant actions to reduce fuel oil consumption (-12% in 2018 compared to 2017) and stationary diesel -31% in 2018, compared to the previous year). These results indicate an energy matrix of 89% from renewable sources. This shows Klabin's commitment to increasingly seek sustainable business alternatives, in line with the UN Sustainable Development Goals.

This is the specific CO2 emissions (ton CO2e / ton of product) for Klabin S.A products using the Brazilian GHG methodology. This allocation result is based on the specific emission of CO2e for each ton of product supplied to the customer in 2018. The GHG Protocol is a tool used to understand, quantify and manage GHG emissions. is now the most widely used method worldwide by companies and governments to conduct GHG inventories. It is also compatible with ISO 14.064 and the methods of quantification of the Intergovernmental Panel on Climate Change (IPCC). This inventory of greenhouse gases is verified and audited by third parties (scopes 1, 2 and 3), attesting the veracity of the data and publicly reported results. Klabin conducts its inventory of greenhouse gases and reports this information publicly since 2010. As the program is already consolidated within the organization there are no limitations to the inventory, since all the data generated internally are available for elaboration of the inventory.

This is the specific CO2 emissions (ton CO2e / ton of product) for Klabin S.A products using the Brazilian GHG methodology. This allocation result is based on the specific emission of CO2e for each ton of product supplied to the customer in 2018. The GHG Protocol is a tool used to understand, quantify and manage GHG emissions. It is now the most widely used method worldwide by companies and governments to conduct GHG inventories. It is also compatible with ISO 14.064 and the methods of quantification of the Intergovernmental Panel on Climate Change (IPCC). This inventory of greenhouse gases is verified and audited by third parties (scopes 1, 2 and 3), attesting the veracity of the data and publicly reported results. Klabin conducts its inventory of greenhouse gases and reports this information publicly since 2010. As the program is already consolidated within the organization there are no limitations to the inventory, since all the data generated internally are available for elaboration of the inventory.

Principais fontes de emissões

This is the specific CO2 emissions (ton CO2e / ton of product) for Klabin S.A products scope 2 using the Brazilian GHG methodology. This allocation result is based on the specific emission of CO2e for each ton of product supplied to the customer in 2018. Thus, total CO2e emissions are composed of the multiplication between the reported value of emissions by the total quantity of product supplied to the customer. This reported result is related to the amount of GHG emissions related to Scope 2 by the location-based method. These issues are related to the total amount of energy purchased by Klabin S/A in 2018. It is important to note that since 2017 Klabin has also reported its scope-2 emissions by the market-based method. In 2018, 60.5% of the amount of energy purchased was reported as being from a renewable source with its respective generator declaration.

SC1.2

(SC1.2) No caso de terem sido publicadas informações na questão SC1.1, forneça referências.

The reported results of greenhouse gas emissions from Klabin S/A are available on the Brazilian Public Emissions Registry platform.

The Public Register of Emissions is a platform developed by the Brazilian GHG Protocol Program that assists in the publication of the inventories of greenhouse gas (GHG) emissions from member organizations of the Program.

It is currently the largest database of corporate inventories in Latin America.

The results can be found on the website:

<https://www.registropublicodeemissoes.com.br/participantes/1461>

SC1.3

(SC1.3) Quais os desafios de alocar emissões para diferentes clientes e o que o ajudaria a vencer esses desafios?

| Desafios de alocação | Por favor, explique o que o ajudaria a vencer esses desafios |
|--------------------------|--|
| Não enfrentamos desafios | Klabin conducts its greenhouse gas inventory and publicly informs this data since 2010. Since the program is already consolidated within the organization, there are no quantification limitations, since all internally generated data is available for inventory preparation. The GHG Protocol is a tool used to understand, quantify and manage GHG emissions. It is now the most widely used method in the world by companies and governments to conduct GHG inventories. It is also compatible with ISO 14.064 and the methods of quantification of the Intergovernmental Panel on Climate Change (IPCC). This inventory of greenhouse gases is verified and audited by third parties (scopes 1, 2 and 3), attesting to the veracity of the data and publicly disclosed results. Thus, considering the calculation of specific emissions for the products produced by Klabin S/A, we do not identify challenges so that it is possible to make available to our customers the specific emissions information of the organization. |

SC1.4

(SC1.4) Você planeja desenvolver futuramente recursos para alocar emissões para seus clientes?

Sim

SC1.4a

(SC1.4a) Descreva como planeja desenvolver seus recursos.

Klabin conducts its greenhouse gas inventory and publicly informs this data since 2010. Since the program is already consolidated within the organization, there are no quantification limitations, since all internally generated data is available for inventory preparation.

Still, the development of studies and maps of externalities in Klabin's operation, together with the complete life cycle analysis of all its products, could provide better conditions for allocating emissions to different customers.

Klabin performed the Life Cycle Analysis and calculated the carbon footprint for the company's 3 main products. These studies indicate that the amount of CO2 captured from the atmosphere during photosynthesis is greater than that emitted by Klabin's production process.

We are currently carrying out new life cycle analysis studies to evaluate the paper produced by the organization, for the commercialized pulp which is produced in the PUMA unit and, in addition, we are conducting life cycle analysis studies for our industrial bags produced in the Lages unit.

Detalhes da proposta

The PUMA unit, located in the municipality of Ortiguera (Paraná), produces more energy from renewable sources than demand for its production requires, allowing Klabin to generate International Renewable Energy Certificates (IRECs) for all the energy that was made available in the national system (888,686.03 MWh). To maintain this opportunity, in 2018 the PUMA unit was the first unit in the country's pulp sector to achieve ISO 50001 certification, attesting to the unit's efforts to improve its performance and energy efficiency. The I-REC Service is a global environmental energy attribute tracking system designed to facilitate reliable carbon accounting for Scope 2, consistent with various international carbon accounting standards. For Klabin, registration at the I-REC Service is a way to obtain additional revenue from the commercialization of renewable energy certificates, contributing to a cleaner energy matrix. This demonstrates Klabin's commitment to the purchase of renewable energy, in accordance with its Sustainability Policy. This can be an important partnership between Klabin and its customers in pursuit of joint projects to reduce GHG emissions from scope 2 of our partners.

Tipo de grupo de projetos

Reducir emissões de logística

Tipo do projeto

Logística consolidada

Descrição da iniciativa de redução

With the construction of the PUMA unit and with the objective of improving the logistics of distribution of the pulp produced in the unit to the port terminal for commercialization, Klabin built a stretch of railroad to transport the pulp. The use of pulp rail transport in the Klabin PUMA stretch and the city of Paranaguá (Parana state) in the year 2018 prevented approximately 28 thousand truck transportation on the BR376 highway in one year. This corresponds to a reduction of 978 tonnes of CO₂e when we compare the emission of heavy vehicles with the railway emission.

Redução de emissões no ano de referência em toneladas métricas de CO₂e

Descrição da iniciativa de redução

It is important to mention that, according to Klabin's objectives and commitments, in this year 2018 we reduced the consumption of non-renewable fuels for energy generation by 7%, mainly from constant actions to reduce the consumption of fuel oil (-12% in 2018 compared to 2017) and diesel (-31% in 2018, in relation to 2017). We can also highlight the increase in hydroelectric power generation by 19%. These results indicate an energy matrix of 89.17% from renewable sources. In relation to scope 1 of the GHG emissions of Klabin S / A, this result corresponds to a reduction of 40,299 tCO₂e.

Redução de emissões no ano de referência em toneladas métricas de CO₂e

40299

Descrição da iniciativa de redução

It is important to mention that, according to Klabin's objectives and commitments, in this year 2018 we reduced the consumption of non-renewable fuels for energy generation by 7%, mainly from constant actions to reduce the consumption of fuel oil (-12% in 2018 compared to 2017) and diesel (-31% in 2018, in relation to 2017). We can also highlight the increase in hydroelectric power generation by 19%. These results indicate an energy matrix of 89.17% from renewable sources. In relation to scope 1 of the GHG emissions of Klabin S / A, this result corresponds to a reduction of 40,299 tCO₂e.

Redução de emissões no ano de referência em toneladas métricas de CO₂e

40299

Você identificou esta oportunidade como parte da iniciativa Action Exchange da cadeia de fornecimento do CDP?

Tipo de grupo de projetos

Mudança nas operações do fornecedor

Tipo do projeto

Aumento dos níveis de energia renovável adquirida

Descrição da iniciativa de redução

Since 2017, Klabin began to record part of the indirect emissions through the Approach based on the choice of purchase (Marketbased). In this approach Klabin quantifies GHG emissions of scope 2 using the specific emission factor associated with each source of electricity generation that Klabin has chosen to acquire. In this year 2018, Klabin acquired 696.089,40 MWh from hydroelectric generation, with the appropriate Declaration of the generator. This represent a 58% reduction of the Scope 2 emissions (51,342 tCO₂e), when compared to the Location-based Approach, which uses the average emission factor of the SIN (National Interconnected System).

SC3.1a**(SC3.1a) Identifique quais membros, se houver algum, motivaram você a participar do Action Exchange neste ano.**

Unilever plc

Tesco

PepsiCo, Inc.

L'Oréal

SC3.1b**(SC3.1b) Selecione os tipos de atividades de redução de emissões que sua empresa gostaria de apoiar na análise ou implementação no próximo ano de referência.**

Eficiência energética: Revestimento de construção

Eficiência energética: Processos

Aquisição de energia com baixos níveis de carbono

Instalação de energia com baixos níveis de carbono

Reduções de emissões de processos

Design do produto

Financiamento de projetos ecológicos

SC3.1c**(SC3.1c) Como parte da Action Exchange, você gostaria de uma análise no nível de instalação?**

Sim

SC3.2**(SC3.2) Sua empresa é uma fornecedora participante da iniciativa Action Exchange 2018-2019 do CDP?**

Sim

SC3.2a

(SC3.2a) Descreva como sua empresa considerou ativamente os projetos de redução de emissões como resultado do Action Exchange. Se você não tiver nenhuma atividade de redução de emissões resultante da Action Exchange em qualquer estágio de implementação, por favor, explique por que não na segunda coluna.

| Tipo do projeto | Detalhes da proposta |
|---|--|
| Linha 1 Eficiência energética: Processos Aquisição de energia com baixos níveis de carbono Instalação de energia com baixos níveis de carbono Reduções de emissões de processos Transporte: uso | Our vision to the future is that of a substantial larger company that is increasingly recognized for the excellence of its products and services, built on solid foundations of sustainability and innovation. In 2018, we were not sued for any unfair competition, antitrust, of monopoly practices, and we continue to take this stance as a priority. Klabin has also restructured its team and created a specific corporate area of Sustainability and Environment that has as one of its objectives of monitoring global and national climate agendas and mapping their related risks and opportunities. In this year 2018, Klabin acquired 696,089,40 MWh from hydroelectric generation, with the appropriate Declaration of the generator. This represent a 58% reduction of the Scope 2 emissions, when compared to the Location-based Approach, which uses the average emission factor of the SIN (National Interconnected System). In this year the results of emissions rate field with and emissions inventory, verified by third part, developed according to the Brazilian GHG Protocol Program. It is important to mention that, in this year 2018 we reduced the consumption of non-renewable fuels for energy generation by 7%, mainly from constant actions to reduce the consumption of fuel oil (-12% in 2018 compared to 2017) and diesel (-31% in 2018, in relation to 2017). These results indicate an energy matrix of 89.17% from renewable sources. In relation to scope 1 of the GHG emissions of Klabin S/A, this result corresponds to a reduction of 40,299 tCO2e. Also, the use of pulp rail transport in the Klabin PUMA stretch and the city of Paranaguá (Parana state) in the year 2018 prevented truck transportation on the BR376 highway, corresponding to a reduction of 978 tonnes of CO2e. As part of the expansion, Klabin will contribute about BRL 180 million in Industrial and Forestry Research in the years 2019-2021. Many of these actions and results are directly linked to the growth that the sustainability theme is gaining proportions within the organization and the market. Klabin S/A's voluntary adherence in 2016 to the UN's sustainable development goals has increasingly leveraged projects that present gains in sustainability for the entire business chain aligned with the growth strategy and business continuity. |

Explicação sobre a variação

No significant change Klabin performed the Life Cycle Analysis and calculated the carbon footprint for the company's 3 main products. These studies indicate that the amount of CO2 captured from the atmosphere during photosynthesis is greater than that emitted by Klabin's production process. We are currently carrying out new life cycle analysis studies to evaluate the paper produced by the organization, for the commercialized pulp which is produced in the PUMA unit and, in addition, we are conducting life cycle analysis studies for our industrial bags produced in the Lages unit.

SC4.2c

(SC4.2c) Detalhe a redução de emissões realizada ou planejada para este produto.

| Nome do bem/serviço | ID da iniciativa | Descrição da iniciativa | Realizada ou planejada | Reduções de emissões em kg de CO2e por unidade |
|--|------------------|--|------------------------|--|
| Liquid Paper Board (LPB), Carrier Board and Kraftliner | Iniciativa 1 | In the year 2018, we reduced the consumption of fuel oil by 2,548,747 liters through actions for operational continuity and reduction of the use of fossil fuels in the Monte Alegre unit, responsible for the production of these products. These actions resulted in a reduction of 1195 tCO2e compared to the year 2017, which is equivalent to a reduction of 1.22 kg of CO2 for each ton of product produced. | Realizada | 1.22 |
